

# SOLAR GARDEN LIGHT

## Instruction Guide For Solar Address Dog (009-010)

### **PLEASE READ THE FOLLOWING PRIOR TO INSTALLATION**

IMPORTANT: This product contains a rechargeable Ni-CD/MH battery. Once the battery life is exhausted the battery must be disposed or recycled properly according to your local laws. Please contact your local disposal or refuse collection agency for more information.

1) Move the power switch to the "ON" position by pressing against the on switch on back of the address unit. Your solar light will **not** charge in the "OFF" position. **Be sure to install your solar light where there are no street lights or porch lights that may prevent your light from turning on or very dim at night. The darker the area is, the brighter it will be.** How long the unit lights up at night depends on the weather locations, conditions & sunlight availability.

2) Install your solar address number unit by aligning the number stickers evenly. You may use a ruler or a pencil to do so. After that, peel off the stickers and stick them on. Please refrain from getting them dirty, as this may cause them to lose its stickiness. Keep the numbers for future use, in case the stickers is damaged. Bend to open the chain end with a pair of pliers, attach to the dog and bend it back to secure it. Lastly, make sure the area has virtually no obstructions and charge it for at least 8 hours to ensure maximum duration output.

### **3) Troubleshooting :**

\* **Unit doesn't light up:** after being charged for a day, open the battery compartment, check to be sure the battery ends contact fully( Jiggle it if necessary). Swap new battery (can use the working light battery for a quick test if the new battery is unavailable), if light up, new battery is needed, if not, the unit is defective (**All the test should be perform in a dark area to deactivate the photocell sensor built-in the solar panel top or cover the top panel completely with towel or lay upside down on the floor**).

\***Unit last a couple hours at night:** swap to a place with more sun light, if condition is still the same, new battery is needed.

**NOTE: Most of solar lights must have a 6 to 8 hours of full sun in order to charge its internal rechargeable battery. On cloudy days, it only receives the charging at minimum stage & won't last very long at night so how long the unit lights up at night depends on the weather locations, conditions & sunlight availability.**
