

# SOLAR GARDEN LIGHT

## Instruction Guide for Flamingo solar light (FLAM34)

### **PLEASE READ THE FOLLOWING PRIOR TO INSTALLATION**

IMPORTANT: This product contains a rechargeable Ni-CD/MH battery. Once the battery life is exhausted the battery must be disposed or recycled properly according to your local laws. Please contact your local disposal or refuse collection agency for more information.

1. Spread the two side rails slightly which hold the ball and pull out the ball. Turn the switch on. Attach the wings by hanging their hooks onto the side clips on each side of the circle rails and the tail to the back of body hook. Attach the stake bar until firmly secure (hand tight only). Install your light in direct sunlight for at least one (1) day. This is important so that your batteries are fully charged for a full night of lighting. The photocell sensor will turn the light automatically on at dusk, off at dawn. **The solar light will not charge the battery in the "OFF" position.**

2. Select an area to install your solar lights that is free of any obstructions that may cause shading to the solar panels. **Be sure to install your solar light where there are no street lights or porch lights that may prevent your light from turning on or very dim at night. The darker the area is, the brighter it will be.** How long the unit lights up at night depends on the weather locations, conditions & sunlight availability.

3. Please allow 10-12 charge & discharge cycles to maximize battery life.

4. It is recommended that your battery be replaced every one (1) or two (2) years when the duration of light reduces significantly at night.

5. Battery replacement: twist and remove the unit to reach to the battery compartment, remove the battery covers, replace with the same or higher MAH ones ( must have the same AA1.2voltsx600 or higher 700, 900, 1000 MAH).

6. Trouble shooting:

\* **Unit doesn't light up:** after being charged for a day, open the battery compartment, check to be sure the battery ends contact fully( Jiggle it if necessary). Swap new battery (can use the working light battery for a quick test if the new battery is unavailable), if light up, new battery is needed, if not, the unit is defective (**All the test should be perform in a dark area to deactivate the photocell sensor built-in the solar panel top or cover the top panel completely with towel or lay upside down on the floor**).

\***Unit last a couple hours at night:** swap to a place with more sun light, if condition is still the same, new battery is needed.

**NOTE: Most of solar lights must have a 6 to 8 hours of full sun in order to charge its internal rechargeable battery. On cloudy days, it only receives the charging at minimum stage & won't last very long at night so how long the unit lights up at night depends on the weather locations, conditions & sunlight availability.**
