

Correlations between Outcome Scores

“Firefighter Hearing Health”

Acknowledgements

- Federal Emergency Management Agency (FEMA), U.S. Department of Homeland Security (EMW-2007-FP-00785, PI:Hong) 
- Participants from fire departments in CA, IL, & IN
- Omaha System Partnership for Knowledge Discovery and Health Care Quality

Introduction

- Noise-induced Hearing Loss (NIHL):
One of most prevalent occupational injuries among firefighters in the U.S.
- Need in measurement of outcomes of hearing loss prevention programs
- “Omaha System Problem Rating Scale for Outcomes”:
Standardized language represent health outcomes relative to hearing problem

Modeling Relationships

- It is difficult to understand relationships between educational interventions, behavior changes, and health outcomes.
- Omaha System Knowledge, Behavior and Status framework enables investigation of associations between hearing health outcomes

Purpose

- “Correlations” between standardized hearing health variables
 - : KBS variables by definitions of Omaha System rating

Knowledge

Behavior

Status

Method

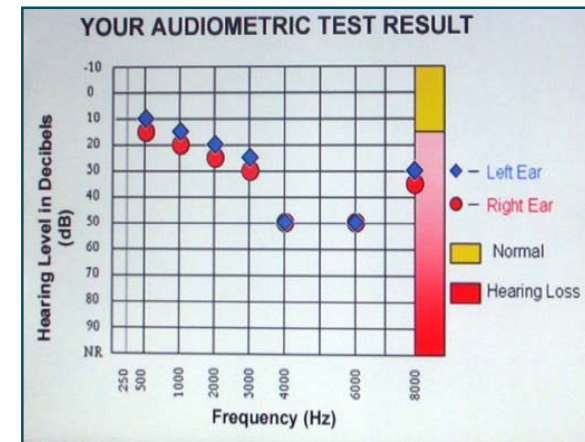

- Secondary analysis from

Internet-based survey

Hearing assessment

Knowledge

Behavior

Status

(*) S.I.R.E.N. (Safety Instruction to Reduce Exposure to Noise and Hearing Loss)

Participants

- **346 firefighters from CA, IL, and IN**

| Characteristics | Mean |
|--|-------------|
| Age (Years) | 45 |
| Years of work in fire service | 17 |
| Characteristics | % |
| Ethnicity (Caucasian or White) | 81 |
| Gender (Male) | 94 |
| Loud noise exposure at job site (daily/weekly) | 84 |

| Standardized Outcomes | Omaha System Rating | SIREN Data | Mean |
|------------------------------|--|--|-------------|
| <u>K</u>NOWLEDGE | <p>Ability of the client to remember & interpret information</p> <p>1=no knowledge 5=superior knowledge</p> | <p>Four questionnaire items on Noise-induced hearing loss and its prevention</p> <p>1=no correct answers 5=4 correct answers</p> | 3.7 |
| <u>B</u>EHAVIOR | <p>Observable responses, actions, or activities of the client fitting the occasion or purpose</p> <p>1=not appropriate behavior 5=consistently appropriate behavior</p> | <p>% of time of Use of hearing protection device(HPD)</p> <p>1= 0 to 20% 5=81 to 100%</p> | 2.2 |
| <u>S</u>TATUS | <p>Condition of the client in relation to objective and subjective defining characteristics</p> <p>1= extreme signs/symptoms 5=no signs/symptoms</p> | <p>Objective hearing status</p> <p>1=above 80dB 5=less than 25dB</p> | 4.4 |

Data Analysis

- **SPSS 18.0**
- **Descriptive statistics**
- **Nonparametric analysis**
 - “KBS” variables are categorical variables with skewed distributions
 - **Spearman’s rho correlations**

Correlations between “KBS”

The level of statistical significance: $p < .05$

| SCALE | Knowledge | Behavior | Status |
|-----------|---|---|--------|
| Knowledge | 1 | - | - |
| Behavior | 0.13 ($p=0.01$) | 1 | - |
| Status | -0.07 ($p=0.19$) | 0.12 ($p=0.02$) | 1 |

→ Significant correlation: knowledge-Behavior & Behavior-Status

Conclusion

- **Firefighters having higher-level knowledge on NIHL used HPDs more frequently.**
- **Firefighters frequently used HPDs showed better hearing status.**
- **Future studies**
 - Comparison between the baseline and the current hearing assessments of firefighters
 - Compare between the “KBS” scores to other populations of interest for the hearing problem

(*) NIHL: Noise-induced hearing loss, HPD: hearing protection device

Implications

- **Standardizing health data will create opportunities**
 - further analysis of the way in which knowledge-behavior-status changes occur.
 - enable data exchange across occupational health and other care settings.
- **Data exchange will support population-based hearing health assessments and outcomes.**

Thank you! & Questions!
