

About the Author

I am a software development manager residing in Noida, India. My primary interest is mathematics. Readers are expected to see a reasonable amount of mathematical content (although I will try to simplify things a little bit so as to make it more accessible to people).

My day job requires me to handle projects done mostly in C/C++ and I have been doing so for more than 13 years. My area of expertise includes multimedia technologies on Google's Android platform. I am also familiar with various video compression formats like MPEG-4, H.264, VC1, VP8, VP9 and HEVC.

I have a [profile at math.stackexchange.com](#) and also maintain a [non-mathematical blog](#).

About this Blog

This blog uses [MathJax](#) for rendering all mathematical symbols and takes some time to load and therefore patience is advised to get the mathematical symbols rendered properly. Mathematical content can be zoomed to twice the size by double clicking it.

It is advisable to use desktop mode on the mobile browsers otherwise the MathJax content will be disabled. Moreover while using mobile devices it is preferable to use Firefox as it is the only mobile browser with support for CSS embedded web-fonts and thus renders the blog posts in exactly the same look as seen on desktop browsers.

All the content published on the blog is available for public use under the [Creative Commons Attribution-ShareAlike \(CC BY-SA\) license](#). Readers should feel free to make use of it in any way they want as long as they credit this blog for original creation and release derivative work with the same Attribution-ShareAlike license.

Comment Policy

Comments on this blog are moderated, but at the same time these are normally approved on ASAP basis unless the comments are completely irrelevant. Readers should therefore provide prompt feedback and suggestions if they so desire. Mathematical content (using \LaTeX commands) can be put in comments using one of the two common mechanisms provided by MathJax:

- For inline mathematical content write like $\langle \text{math content} \rangle$ (without the angle brackets)
- For displaying large math equations use either of the two approaches below:
 - $\langle \text{math content} \rangle$
 - $\displaystyle \langle \text{math content} \rangle$

The comments also become a part of this blog and are therefore covered under the same license with attribution to the comment author.
