

## MINIMUM PRODUCT REQUIREMENTS

Hazy is packaged using Docker and installed onto a VM environment that you provision. The minimum recommended specification for a Hazy VM is:

1. 8-core processor
2. 128GB RAM
3. 1TB SSD

Hazy runs on any system running Docker. We recommend [Red Hat Enterprise Linux \(RHEL\)](#) or [Ubuntu Server](#).

Access to the Hazy system is entirely locked down by your environment security. It runs within your firewall and only has the access that your network security rules allow. No data should be able to leave a Hazy environment except via your provisioning mechanisms.

### Real world usage

The hardware requirements for real world deployments are impacted by:

- data size and throughput requirements
- data structure and contents
- workflow and use case requirements

More information is available on <https://docs.hazy.com/installation.html>
