

**Falk™ Steelflex® Grid Couplings** | **Redefining Total Coupling Value**  
(English-Metric)

# Falk™ Steelflex®

## The simplest, most cost-effective coupling

The Falk name is synonymous with grid couplings, as well as using shot peening to increase fatigue strength and torque ratings.

Steelflex redefines total coupling value up to 7.5 million in-lb, 932 000 Nm torque. Steelflex offers simpler initial installation than gear couplings, and our new HD design outlasts competitive gear couplings 2 to 1.

The unique “replace in place” design eliminates the need to move hubs or re-align shafts, reducing element change-out time.

When you look (see chart below) at the overall savings in initial costs, spare parts costs, and labor costs for installation, alignment and replacement - plus improved ratings and a 5 Year Heavy-Duty Warranty - it’s easy to see what Steelflex Grid Couplings have over the competition. No other coupling in the torque range can touch Steelflex for cost-effective performance and reliability.

### Features That Give Steelflex the Lowest Lifetime Operating Cost

#### Longer Life

Tapered grids, made of high strength alloy steel, are quenched and tempered to spring hardness. The grid surface is then precision shot peened to compress the surface molecules.

The effect is a dramatic increase in rating, providing reserve strength for longer life or allowing a smaller size coupling to be selected.

This precision technology was originally used in the production of sophisticated aircraft components.

#### Extended Maintenance Periods

Now you can install Steelflex and lubricate it with Falk Long Term Grease (LTG) and forget periodic, routine maintenance for five years.

Falk LTG grease was developed specifically for couplings. It resists the separation of the oil and thickening agent that occurs in typical greases.

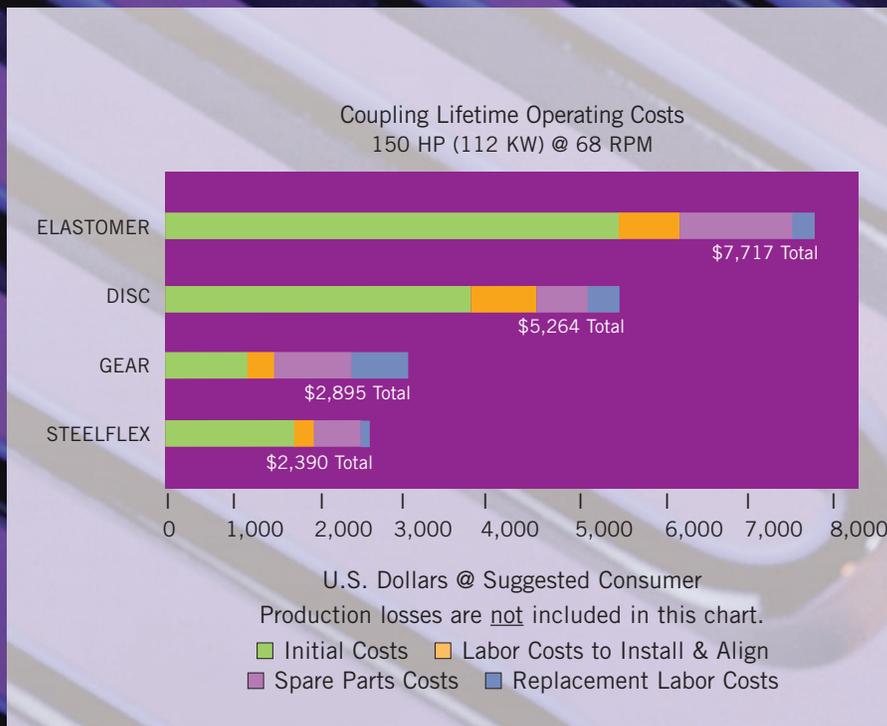

The initial use of Falk LTG coupling grease will eliminate routine lubrication cycles while still providing the necessary lubrication to the tapered grid.

With LTG, Steelflex combines the high torque performance of a gear coupling and the low maintenance of a disc or elastomer coupling.

### Type HD Couplings

#### The Preferred Replacement for Gear Couplings

- Durable Nitrile Seals are heat resistant to 275° F. (135° C.)
- Powder-coated covers provide chemical resistance.

## Quick, Easy Installation... Replace-In-Place Design

The grid is the wearing member of a Steelflex coupling and it is a fraction of the complete coupling cost. Tapered grids are accessible through the quickly removable cover.

The replace-in-place design of the replacement grids allows them to be dropped in without the need to remove or reposition hubs or realign shafts as required with gear couplings and many elastomer designs.

When coupling-connected equipment must be moved, the job takes longer and costs a lot more.

## Equipment Protection Against Shaft Misalignment

The grid is free to rock, pivot and float within the hub teeth. Generous misalignment capacity is provided without producing detrimental bearing side loads created by other couplings.

## Equipment Protection Against Shock/Vibratory Loads

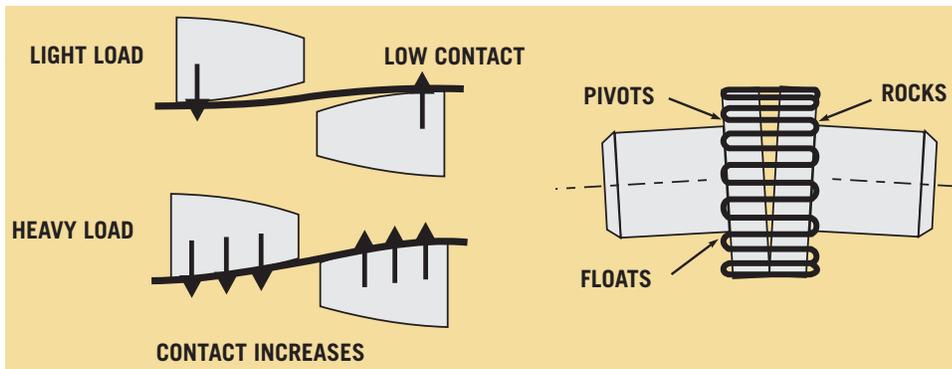

Torsional flexibility is the ability of Falk Steelflex couplings to torsionally deflect when subjected to normal shock or vibratory loads, providing flexible accommodation to changing load conditions.

Consequently, Steelflex tunes the drive system.

It absorbs impact energy by spreading it over an increment of time. It damps vibration and reduces peak or shock loads by as much as 30%. It is a true shock absorber for rotary motion, relying on the predictable resilience of the steel grid for torsional flexibility.

**Steelflex HD Grid Couplings –  
The preferred replacement for  
gear couplings**

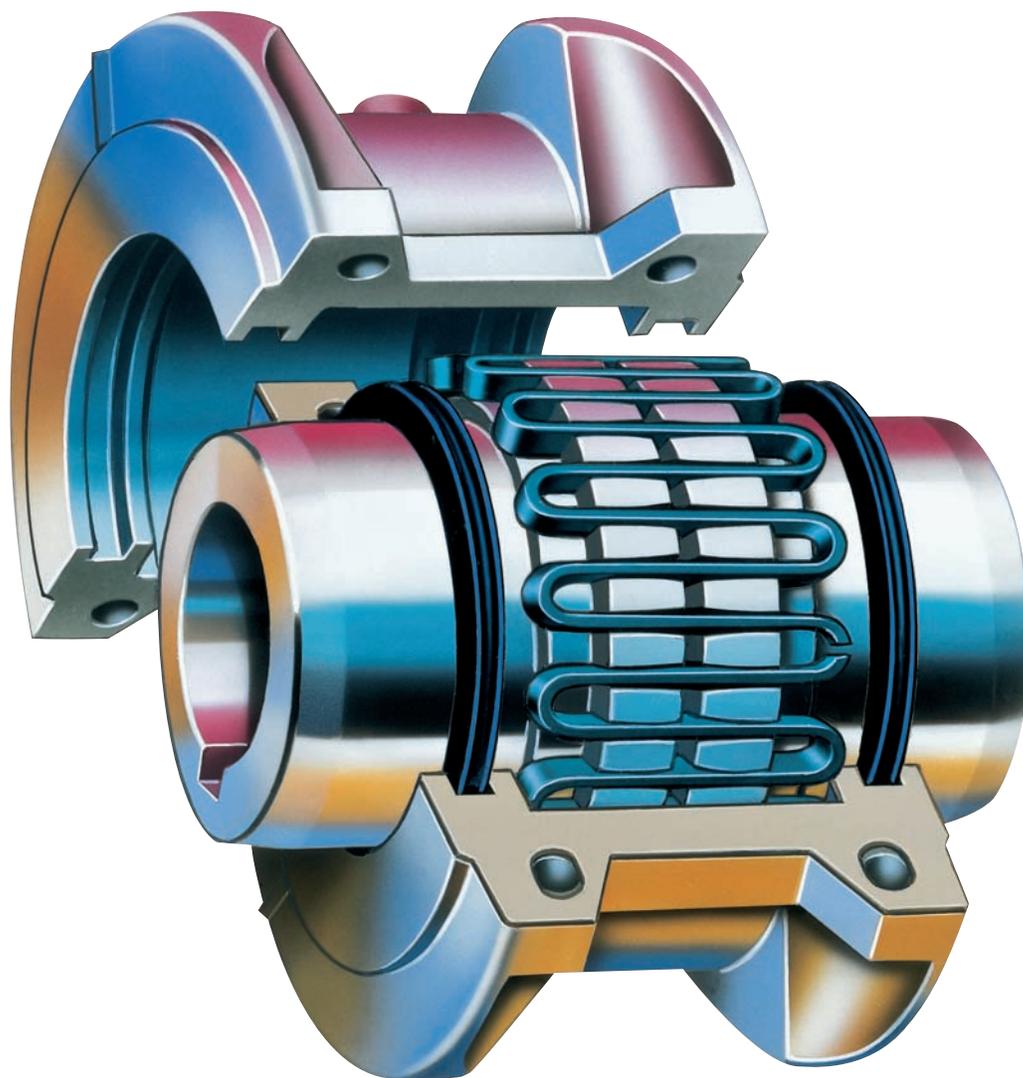

## Versatile Designs

Two cover designs are available in the popular sizes. Standard spacer, piloted, high speed, brakewheel or disc, and controlled torque designs are also available.

## Worldwide Availability

Steelflex couplings and component parts, are available in popular sizes and types. Our distribution centers and worldwide distribution network offer the largest stock of rough bore, finish straight bore and Taper-lock bushed hubs of any shaft coupling on the market. Plus, Steelflex grid couplings are warranted for 5 Years when lubricated with Falk LTG Long Term Grease.

**Factory Warranty** We're so confident in the performance and reliability of our latest generation of Falk gear drives that we're backing this comprehensive offering with the best standard warranty in the business. Our full, 3-year Heavy-Duty Warranty provides "shaft-to-shaft" protection on all Falk components – including bearings and seals. It's an industry first... and one more powerful reason why Rexnord is your ultimate bottom-line drive and coupling value.★ Steelflex grid couplings are warranted for 5 years when lubricated with Falk LTG Long Term Grease.

★ Warranty extends for 3 years from date of shipment.

## All Falk Steelflex® Couplings Possess the Following Benefits

- High Ratings
- Extended Maintenance Periods
- Quick Installation
- Easy Maintenance
- Versatile Design
- Availability
- Protection Against Shaft Misalignment
- Protection Against Shock Loads, Vibration and Thrust Loads

## General Information

- Rexnord standards apply unless otherwise specified.
- All Dimensions are for reference only and are subject to change without notice unless certified.
- Unless otherwise specified, Falk coupling hubs Sizes 1020T thru 1090T will be bored for CLEARANCE FIT with a setscrew OVER the keyway, and Sizes 1100T and larger will be furnished for INTERFERENCE FIT without a setscrew (see Table 27, Page 43). Recommended key sizes for the listed maximum bores are shown in Table 13 on Page 36.
- Torque ratings of couplings utilizing Taper-Lock bushings can differ from those that do not. Refer to the Factory for details.
- If Rexnord is to supply coupling hubs bored for Taper-Lock bushings, the bushing manufacturer MUST be noted on the order.
- Consult the Factory when limited end float is required.

## Reference Notes

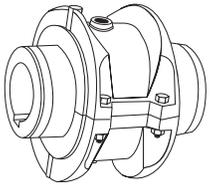

- † Peak torque capacity is two times the published rating. Torque ratings for hubs with bushings differ from those shown, refer to Table 19, Page 39.
- ‡ Consult the Factory for higher speeds.
- Maximum bores are reduced for hubs furnished with an INTERFERENCE FIT and a setscrew OVER the keyway. Refer to Rexnord Engineering Sheet 427-105 for details.
- Minimum bore is the smallest bore to which a RSB hub (rough stock bore) hub can be bored. Depending upon coupling size, rough stock bore hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

The contents of this selection guide are subject to change without notice or obligation. Information contained herein should be confirmed before placing orders.

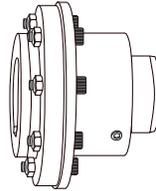

# Falk Steelflex Grid Couplings

A general purpose, lubricated design that combines the economy and high torque capacity of a gear coupling with the torsional flexibility of an elastomer coupling. Backed by a 5-year lubrication warranty, Falk Steelflex couplings require no periodic maintenance when lubricated with Falk LTG (Long Term Grease) at installation. Featuring 25 sizes, Steelflex couplings can accommodate torque loads of 932 000 (Nm) and shaft diameters of 508 millimeters.

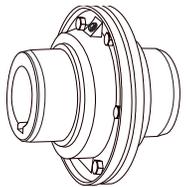

A double flexing, close-coupled design for use in four bearing systems. Features a horizontally split cover which allows for grid replacement without the movement of the connected equipment. (See Page 14.)

Type T10 Close Coupled

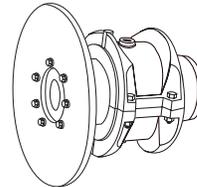

For use on line shaft applications. Can be used in place of single engagement gear couplings to provide torsional resiliency and lower overall operating cost. (See Pages 28 & 29.)

Type T50 Piloted

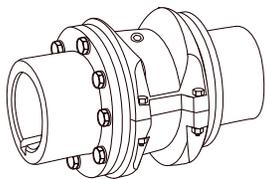

A double flexing design featuring a vertically split steel cover. Ideal for higher running speeds. (See Page 15.)

Type T20 Close Coupled

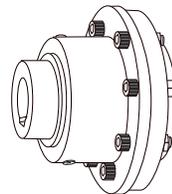

Proven to be far superior to drum-type brakes in cost, construction and performance. (See Pages 30 thru 32.)

Type T63 Disc Brake

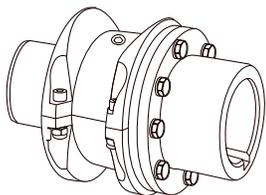

Complete center section drops out for easy service of connected equipment bearings and seals. Ideal for pump applications. (See Pages 16 & 17.)

Type T31 Full Spacer

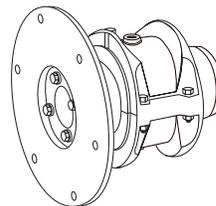

Designed for operating speeds beyond those of the T10 and T20 designs. Features a one-piece cover and balanced components. (See Page 33.)

Type T70 High Speed

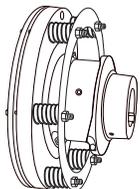

An economical spacer design for easy service of connected equipment bearings and seals. Ideal for pump applications. (See Pages 18 & 19.)

Type T35 Half Spacer

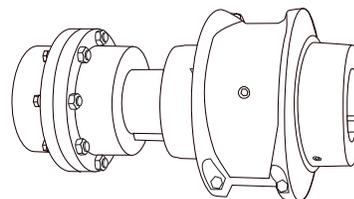

Used primarily to connect the flywheel of an engine to the driven machinery. It provides for higher torque ratings with resulting smaller sizes and lower costs than elastomer couplings. (See Page 34.)

Type T90 Flywheel

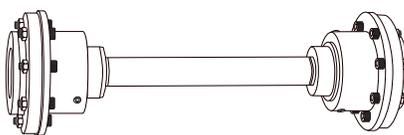

Provides adjustable slipping action to protect connected equipment from shock, jams, or temporary overloads. (See Pages 20 thru 27.)

Type T41, T42, T44 & T45 Controlled Torque

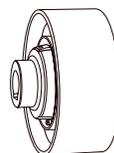

A combination of two standard Falk couplings. Utilizes readily available components for an economical price and shorter lead time than T31/T35 couplings. (See Page 35.)

Type T10/G82 Spacer

Type T50 Floating Shaft

Double piloted design for connecting equipment where the distance between shafts is too large for a spacer type coupling. (See Pages 28 & 29.)

Type BW Brakewheel

Provides a built-in braking surface right at or near the centerline of the coupling . . . saves space and dollars. (See Selection Guide 431-310.)

**WARNING! Mixing grid coupling components from different manufacturers may cause premature failure and possible personal injury or property damage from flying debris.**

# How to Select

## Standard Selection Method (except T41/T44 & T63)

The standard selection method can be used for most motor, turbine, or engine driven applications. The following information is required to select a flexible coupling:

- Kilowatt (kW) or torque
- Running rpm
- Application or type of equipment to be connected (motor to pump, gear drive to conveyor, etc.)
- Shaft diameters
- Shaft gaps
- Physical space limitations
- Special bore or finish information and type of fit

**Exceptions are High Peak Loads and Brake Applications. For these conditions use the Formula Selection Method in the next column, or consult your local Falk Representative for assistance.**

1. **RATING:** Determine system torque. If torque is not given, calculate as shown below:

$$\text{System Torque (Nm)} = \frac{\text{kW} \times 9549}{\text{rpm}}$$

Where kilowatt (kW) is the actual or transmitted power required by the application (if unknown, use the motor or turbine nameplate rating) and rpm is the actual speed the coupling is rotating. Applications that require rapid changes in direction or torque reversals should be referred to Rexnord Engineering.

2. **SERVICE FACTOR:** Determine appropriate service factor from Table 4, Page 12.
3. **REQUIRED MINIMUM COUPLING RATING:** Determine the required minimum coupling rating as shown below:  
Minimum Coupling Rating = S.F. (Service Factor) x Torque (Nm)
4. **TYPE:** Refer to Page 6 and select the appropriate coupling type.
5. **SIZE:** Turn to appropriate pages for the coupling type chosen and trace down the torque column to a value that is equal or greater than that determined in Step 3 above. The coupling size is shown in the first column.
6. **CHECK:** Check speed (rpm), bore, gap, and dimensions.

### STANDARD SELECTION EXAMPLE:

Select a coupling to connect a 55 kW, 1500 rpm electric motor driving a lobe type blower. Motor shaft diameter is 60 mm, blower shaft diameter is 45 mm. Shaft extensions are 140 mm and 110 mm. Selection is replacing a gear type coupling with a 3 mm gap.

1. **DETERMINE REQUIRED RATING:**

$$\text{System Torque (Nm)} = \frac{55 \text{ kW} \times 9549}{1500 \text{ rpm}} = 350 \text{ Nm}$$

2. **SERVICE FACTOR:** From Table 4 = 1.25
3. **REQUIRED MINIMUM COUPLING RATING:**  
 $1.25 \times 350 \text{ Nm} = 438 \text{ Nm}$
4. **SIZE:** From Page 14 a Size 1070T is the proper selection based on a torque rating of 904 Nm exceeding the required minimum coupling rating of 438 Nm.
5. **CHECK:** Allowable speed capacity of 4125 (1070T10) exceeds the required speed of 1500 rpm. Maximum bore capacity of 67 mm exceeds the actual shaft diameters.

## Type T63 Static (holding) Brake Applications

1. **SIZE:** The brake rating must equal or exceed the application requirements. Determine the required coupling size by comparing the application loads (from Steps A and B below) to the coupling brake rating listed on Page 31. Use the highest torque value calculated to determine the coupling size.

- A. For normal service applications, use the application torque in Nm.

$$\text{System Torque (Nm)} = \frac{\text{Transmitted kW} \times 9549}{\text{rpm}}$$

- B. For repetitive high peak load applications, use the system peak torque in Nm. (Repetitive is defined as more than 1000 times during the expected coupling life.)
2. **CALIPER TORQUE BRAKE RATING:** For the coupling size selected, compare the caliper brake torque rating on Page 31 to the holding torque requirement of the application. Rexnord recommends that the caliper torque rating (min.) be at least two times the holding torque requirement for static applications to compensate for the possibility of foreign matter on the disc surfaces, loss of condition of the brake pad surfaces, or other conditions that may affect the holding ability of the caliper brake.

Caliper brakes and brake discs listed are designed primarily for static and/or emergency brake applications. **NOTE:** Check brake system and lining wear after emergency stops. They can, however, also be used for dynamic stopping if only used occasionally, such as shutting down the equipment for the day or between shift changes. For stopping high inertia systems or for applications that require more frequent stopping, consult your local Rexnord Representative.

3. **CHECK:** Check maximum bores, speeds, and dimensions.

## Type T63 Stopping Or Service Brake Applications

1. **SIZE:** The coupling brake rating must equal or exceed the application requirements. Determine the required coupling size by comparing the application loads (from Steps A, B and C below) to the coupling brake rating listed on Page 28. Use the highest torque value calculated to determine the coupling size.

- A. For the selected caliper brake and disc diameter, use the maximum brake torque in Nm.

- B. For normal service applications, use the application torque in Nm.

$$\text{System Torque (Nm)} = \frac{\text{Transmitted kW} \times 9549}{\text{rpm}}$$

- C. For repetitive high peak load applications, use the system peak torque in Nm (Repetitive is defined as more than 1000 times during the expected coupling life.)

2. **CHECK:** Check maximum bores, speeds, and dimensions.

# How to Select

## Formula Selection Method (except T41/T44 & T63)

The Standard Selection Method can be used for most coupling selections. The procedures below should be used for:

- High Peak Loads.
- Brake Applications (where the brake disc or brake wheel is to be an integral part of the coupling, consult the Factory for design options).

Providing system peak torque and frequency, duty cycle, and brake torque rating will allow for a more refined selection using the Formula Selection Method.

- HIGH PEAK LOADS:** Use one of the following formulas for applications using motors with torque characteristics that are higher than normal; applications with intermittent operations, shock loading, inertia effects due to starting and stopping and or system induced repetitive high peak torques. System Peak Torque is the maximum torque that can exist in the system. Select a coupling with a torque rating equal to or greater than selection torque calculated below.

### A. NON-REVERSING HIGH PEAK TORQUE

Selection Torque (Nm) = System Peak Torque  
or

$$\text{Selection Torque (Nm)} = \frac{\text{System Peak kW} \times 9549}{\text{rpm}}$$

### B. REVERSING HIGH PEAK TORQUE

Selection Torque (Nm) = 2 x System Peak Torque  
or

$$\text{Selection Torque (Nm)} = \frac{2 \times \text{Peak kW} \times 9549}{\text{rpm}}$$

- OCCASIONAL PEAK TORQUES (Non-Reversing)** If a system peak torque occurs less than 1000 times during the expected coupling life, use the following formula:

Selection Torque (Nm) = 0,5 x System Peak Torque  
or

$$\text{Selection Torque (Nm)} = \frac{0,5 \times \text{Peak kW} \times 9549}{\text{rpm}}$$

For reversing service select per step B.

- BRAKE APPLICATIONS:** If the torque rating of the brake exceeds the motor torque use the brake rating as follows:

Selection Torque (Nm) = Brake Torque Rating x S.F.

## FORMULA SELECTION EXAMPLE — High Peak Load:

Select a coupling for reversing service to connect a gear drive low speed shaft to a runout mill table roll. The electric motor rating is 37 kW at the base speed and the system peak torque at the coupling is estimated to be 17 000 Nm. Coupling speed is 77 rpm at the motor base speed. The drive shaft diameter is 100 mm with a key of 28 mm x 16 mm. The runout table roll diameter is 135 mm with a key of 36 mm x 20 mm. Maximum shaft gap (BE) is 180 mm long.

- TYPE:** Refer to Page 6 and select the appropriate coupling type.

### 2. REQUIRED MINIMUM COUPLING RATING:

Use the Reversing High Peak Torque formula in Step 1B.

$$2 \times 17\,000 = 34\,000 = \text{Selection Torque}$$

- SIZE:** From Page 19, Size 1150T35 with a torque rating of 39 800 exceeds the selection torque of 34 000 Nm.

- CHECK:** The 1150T35 has a maximum BE dimension of 187,5 mm; the shaft hub has a maximum bore of 270 mm (Table 16, Page 37); the T hub has a maximum bore of 215 mm (Table 15, Page 37); and the allowable speed of 1500 rpm and the dimensions on Page 19 meet the requirements.

**TABLE 1 — Coupling Ratings & Allowable Speeds**

Coupling Size ★	kW/RPM ♦	Torque Rating (Nm) †	Allowable Speeds —rpm ‡			
			T10	T20 & T50 *	T31, T35 & T10/G82	T70
1020T	0,005	52	4500	6000	3600	...

1210T	26	249 000	820	...	...	...
1220T	35,1	336 000	730	...	...	...
1230T	45,6	435 000	680	...	...	...
1240T	58,6	559 000	630	...	...	...
1250T	78,1	746 000	580	...	...	...
1260T	97,6	932 000	540	...	...	...

★ Refer to Page 5 for General Information and Reference notes.

♦ kW/RPM and torque rating values for hubs with Taper Lock ® bushings differ from those shown above. Refer to Table 19, Page 39.

\* Speeds shown above are for single Type T50 couplings; speeds for Type T50 Floating Shaft couplings are shown in Table 12, Page 29.

# How to Select

## Type T41 Controlled Torque Couplings & T44 Controlled Torque Clutches

### Type T41 Controlled Torque Couplings

1. **RUNNING TORQUE:** Calculate normal running torque

$$\text{Running Torque (Nm)} = \frac{\text{Required kW} \times 9549}{\text{rpm}}$$

2. **SLIP TORQUE:** Slip torque = Running Torque x 150% (Overload Setting.) Rexnord recommends a minimum 150% overload setting for steady or moderate shock load applications. For heavy shock load applications, a 200% or greater overload setting may be required.

3. **COUPLING SIZE:** Refer to Table 8, Page 20 — Trace down the Slip Torque column to a figure equal to or in excess of the calculated slip torque determined in Step 2. Read the coupling size in the next column.

#### 4. CHECK:

- Check shaft diameters against coupling maximum bores shown in Table 8, Page 20. If selection does not have adequate bore capacity, refer to Table 15, Page 37 or Table 17, Page 38 for maximum bores with square or rectangular keys, or select the next larger size coupling.
- Check the required speed against the allowable speed shown in Table 8, Page 20. If a higher speed is required, refer application details to the local Rexnord representative.
- Check allowable slip torque times from Slip Torque Performance Charts on Pages 24 through 27. The length of time a coupling can slip without exceeding its thermal capacity is a function of the slip torque setting and the operating speed. An automatic cutout switch, Page 23, can be provided when damaging thermal conditions exist.
- Check application dimension requirements against selected coupling dimensions shown on Page 20.
- Check usable shaft length to the coupling hub lengths on Page 18. If necessary, overhang hubs within the limits specified on Page 23.

#### SELECTION EXAMPLE:

Select a controlled torque coupling to connect a 15,0 kW, 1500 rpm, 160L frame motor to the high speed shaft of a gear drive driving a screw feeder. Motor shaft diameter is 42 mm with a usable shaft length of 110 mm. Drive high speed shaft diameter is 35 mm with usable shaft length of 65 mm.

1. **RUNNING TORQUE:** From Step 1 above:

$$\text{Running Torque (Nm)} = \frac{15,0 \text{ kW} \times 9549}{1500 \text{ RPM}} = 95,5 \text{ Nm}$$

2. **SLIP TORQUE:** From Step 2 above: Slip Torque = 95,5 Nm x 150% = 143,2 Nm.

3. **SIZE:** From Table 8, Page 20, the minimum size coupling is the Size 40T41, which has a maximum slip torque of 167 Nm.

#### 4. CHECK:

- From Table 8, Page 20, the Size 40T41, T41 hub has a maximum bore capacity of only 35 mm and the T hub maximum bore capacity is 43 mm. The preferred mounting arrangement is to have the T41 hub on the motor (for optimum cooling during slippage). Therefore, select the size 50T41 with a T41 hub maximum bore capacity of 45 mm, as compared to the motor shaft diameter of 42mm, and the slip torque required is within its range.
- Allowable Speed of 3600 rpm exceeds required 1500 rpm.
- From Page 24, the Size 50T41 with slip torque setting of 143,2 Nm and running speed of 1500 rpm will permit 27 seconds slip if followed by 9 minutes of non-slip.
- See Page 20 for dimensions.
- Usable shaft length of motor is 110 mm and "W" dimension for T41 hub is 87,4 mm, therefore no overhang required. Usable shaft length of drive is 65 mm and "C" dimension of "T" hub is 60,5 mm, therefore no overhang required.

### Type T44 Controlled Torque Clutches

#### 1. RUNNING TORQUE

$$\text{Running Torque (Nm)} = \frac{\text{Required kW} \times 9549}{\text{rpm}}$$

2. **SLIP TORQUE:** Slip Torque = Running Torque x 150% (Overload Setting.) Rexnord recommends a minimum 150% overload setting for steady or moderate shock load applications. For heavy shock load applications a 200% or greater overload setting may be required.

3. **CLUTCH SIZE:** Refer to Table 9, Page 21 — Trace down the Slip Torque column to a figure equal to or in excess of the calculated slip torque determined in Step 2. Read clutch size in the next column.

- Check shaft diameters against clutch maximum bores shown in Table 9. If selection does not have adequate bore capacity refer to Table 17, Page 38 for maximum bores with square or rectangular keys, or select the next larger size clutch.
- Check the required speed against the allowable speed shown in Table 9. If a higher speed is required, refer application details to the local Rexnord representative.
- Check allowable slip torque times from Slip Torque Performance Charts on Pages 24 through 27. The length of time a clutch can slip without exceeding its thermal capacity is a function of the slip torque setting and the operating speed. An automatic cutout switch, Page 23, can be provided when damaging thermal conditions exist.
- Check application dimension requirements against selected clutch dimensions shown on Page 21.
- Check usable shaft length to the clutch hub length on Page 19. If necessary, overhang hub within the limits specified on Page 23.

# Quick Selection Method

## 1. Select Coupling Type

Refer to Page 6 and select the type of coupling to suit your application. If an application requires a special purpose coupling, refer application details to the local Rexnord Representative.

## 2. Determine Service Factor.

- A. For MOTOR, TURBINE or ENGINE driven applications, refer to Tables 4 and 5.
- B. For BRAKE or HIGH PEAK LOAD applications, refer to the Formula Selection Method shown on Page 8.

## 3. Determine Equivalent Power.

Refer to Table 4 — Under the actual kW required and opposite the service factor determined in Step 2, read the equivalent kW.

## 4. Determine Coupling Size.

A. Refer to Table 4 — Trace horizontally from the required speed to a hp value equal to or larger than the equivalent kilowatts determined in Step 3. Read the coupling size at top of column.

**TABLE 2 — Equivalent Power = (Actual kW x Service Factor)**

Service Factor ‡	Actual kW																														
	0.25	0.37	0.55	0.75	1.1	1.5	2.2	3	4	5.5	7.5	9.2	11	15	18.5	22	30	37	45	55	75	90	110	132	150	185	200	220	250	300	330

T20 Only.

- B. Check shaft diameters against coupling maximum bores shown in Tables 15 thru 18 for the type of coupling selected. If a larger bore is required, select a larger coupling.
- C. Check the required speed against the allowable speed shown in Table 1 for the type of coupling selected. For Type T50 Floating Shaft design, check the allowable speed from Table 12 on Page 29. If a higher speed is required, refer application details to the local Rexnord Representative.
- D. Check application dimension requirements against selected coupling type dimensions shown on Pages 14 thru 35.

Example:

Select a Steelflex coupling to connect the low speed shaft of a gear drive to a belt conveyor. The motor is 250 kW and the low speed shaft RPM is 68. The gear drive shaft is 160 mm and the conveyor shaft is 180 mm.

- 1. Select Coupling Type — To connect close coupled shafts, and to accommodate anticipated shaft misalignment, the double engagement Type T10 coupling shown on Page 14, is the selection.
- 2. Determine Service Factor — From Table 4, Page 12, the service factor is 1.0.
- 3. Determine Equivalent HP — From Table 2, Page 10, the equivalent power is 250 kW.
- 4. Select coupling Size — (A) From Table 3, Page 11, the coupling size is 1150T10 for 68RPM. (B) From Table 3, the maximum bore of 215 mm, and allowable speed of 1500 rpm are all satisfactory. Check other dimensional information on Page 14 against the available shaft lengths, shaft gaps, and diameter restrictions.

◆ For engine drives, refer to Table 5. Electric motors, generators, engines, compressors and other machines fitted with sleeves or straight roller bearings usually require limited end float couplings. In doubt, provide axial clearances and centering forces to the Factory for a recommendation.

- \* For balanced opposed design, refer to the Factory.
- ▲ If people are occasionally transported, refer to the Factory for the selection of the proper size coupling.
- ♠ For high peak load applications (such as Metal Rolling Mills) refer to the Factory.

**TABLE 5 — Engine Drive Service Factors**

Service Factors for engine drives are those required for applications where good flywheel regulation prevents torque fluctuations greater than ±20%. For drives where torque fluctuations are greater or where the operation is near a serious critical or torsional vibration, a mass elastic stud is necessary.

No. of Cylinders	4 or 5 ♡				6 or more ♡					
<b>Table 2 S.F.</b>	1.0	1.25	1.5	1.75	2.0	1.0	1.25	1.5	1.75	2.0
<b>Engine S.F.</b>	2.0	2.25	2.5	2.75	3.0	1.5	1.75	2.0	2.25	2.5

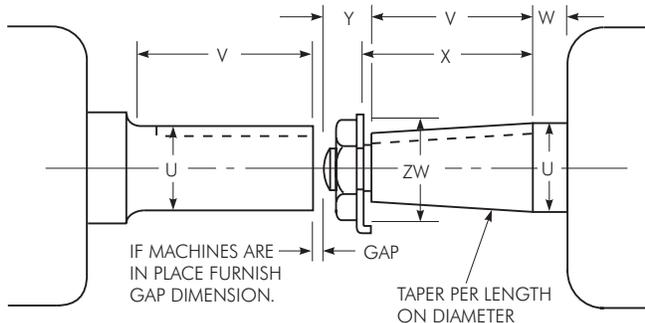

♥ To use Table 5, first determine application service factor from Table 4. Use that factor to determine ENGINE Service Factor from Table 5. When service factor from Table 4 is greater than 2.0, or where 1, 2, or 3 cylinder engines are involved, refer complete application details to Rexnord Engineering.

## Alphabetical listing of industries

Industry	Service Factor
<b>AGGREGATE PROCESSING, CEMENT, MINING KILNS; TUBE, ROD AND BALL MILLS</b>	
Direct or on L.S. shaft of	
Reducer, with final drive	
Machined Spur Gears.....	2.0
Single Helical or	
Herringbone Gears.....	1.75
Conveyors, Feeders, Screens,	
Elevators..... See General Listing	
Crushers, Ore or Stone.....	2.5
Dryer, Rotary.....	1.75
Grizzly.....	2.0
Hammermill or Hog.....	1.75
Tumbling Mill or Barrel.....	1.75
<b>BREWING AND DISTILLING</b>	
Bottle and Can	
Filling Machines.....	1.0
Brew Kettle.....	1.0
Cookers, Continuous Duty.....	1.25
Lauter Tub.....	1.5
Mash Tub.....	1.25
Scale Hopper, Frequent Peaks.....	1.75
<b>CLAY WORKING INDUSTRY</b>	
Brick Press, Briquette Machine,	
Clay Working Machine,	
Pug Mill.....	1.75
<b>DREDGES</b>	
Cable Reel.....	1.75
Conveyors.....	1.25
Cutter head, Jig Drive.....	2.0
Maneuvering Winch.....	1.5
Pumps (uniform load).....	1.5
Screen Drive, Stacker.....	1.75
Utility Winch.....	1.5
<b>FOOD INDUSTRY</b>	
Beet Slicer.....	1.75
Bottling, Can Filling Machine.....	1.0
Cereal Cooker.....	1.25
Dough Mixer, Meat Grinder.....	1.75
<b>LUMBER</b>	
Band Resaw.....	1.5
Circular Resaw, Cut-off.....	1.75
Edger, Head Rig, Hog.....	2.0
Gang Saw	
(Reciprocating)..... Refer to Factory	
Log Haul.....	2.0
Planer.....	1.75
Rolls, Non-Reversing.....	1.25
Rolls, Reversing.....	2.0
Sawdust Conveyor.....	1.25
Slab Conveyor.....	1.75
Sorting Table.....	1.5
Trimmer.....	1.75
♠ <b>METAL ROLLING MILLS</b>	
Coilers (Up or Down) Cold	
Mills only.....	1.5
Coilers (Up or Down) Hot	
Mills only.....	2.0
Coke Plants	
Pusher Ram Drive.....	2.5
Door Opener.....	2.0
Pusher or Larry Car	
Traction Drive.....	3.0
Continuous Caster.....	1.75
Cold Mills —	
Strip Mills..... Refer to Factory	
Temper Mills..... Refer to Factory	
Cooling Beds.....	1.5
Drawbench.....	2.0
Feed Rolls - Blooming Mills.....	3.0
Furnace Pushers.....	2.0
Hot and Cold Saws.....	2.0
Hot Mills —	
Strip or Sheet Mills..... Refer to Factory	
Reversing Blooming..... Refer to Factory	
or Slabbing Mills..... Refer to Factory	
Edger Drives..... Refer to Factory	
Ingot Cars.....	2.0
Manipulators.....	3.0
Merchant Mills..... Refer to Factory	
Mill Tables	
Roughing Breakdown	
Mills.....	3.0
Hot Bed or Transfer,	
non-reversing.....	1.5
Runout, reversing.....	3.0
Runout, non-reversing,	
non-plugging.....	2.0
Reel Drives.....	1.75
Rod Mills..... Refer to Factory	
Screwdown.....	2.0
Seamless Tube Mills	
Piercer.....	3.0
Thrust Block.....	2.0
Tube Conveyor Rolls.....	2.0
Reeler.....	2.0
Kick Out.....	2.0
Shear, Croppers..... Refer to Factory	
Sideguards.....	3.0
Skelp Mills..... Refer to Factory	
Slitters, Steel Mill only.....	1.75
Soaking Pit Cover Drives —	
Lift.....	1.0
Travel.....	2.0
Straighteners.....	2.0
Unscramblers (Billet Bundle	
Busters).....	2.0
Wire Drawing Machinery.....	1.75
<b>OIL INDUSTRY</b>	
Chiller.....	1.25
Oil well Pumping (not over	
150% peak torque).....	2.0
Paraffin Filter Press.....	1.5
Rotary Kiln.....	2.0
<b>PAPER MILLS</b>	
Barker Auxiliary, Hydraulic.....	2.0
Barker, Mechanical.....	2.0
Barking Drum	
L.S. shaft of reducer with	
final drive - Helical	
or Herringbone Gear.....	2.0
Machined Spur Gear.....	2.5
Cast Tooth Spur Gear.....	3.0
Beater & Pulper.....	1.75
Bleachers, Coaters.....	1.0
Calender & Super Calender.....	1.75
Chipper.....	2.5
Converting Machine.....	1.25
Couch.....	1.75
Cutter, Felt Whipper.....	2.0
Cylinder.....	1.75
Dryer.....	1.75
Felt Stretcher.....	1.25
Fourdrinier.....	1.75
Jordan.....	2.0
Log Haul.....	2.0
Line Shaft.....	1.5
Press.....	1.75
Pulp Grinder.....	1.75
Reel, Rewinder, Winder.....	1.5
Stock Chest, Washer,	
Thickener.....	1.5
Stock Pumps, Centrifugal	
Constant Speed.....	1.0
Frequent Speed Changes	
Under Load.....	1.25
Suction Roll.....	1.75
Vacuum Pumps	
1.25	
<b>RUBBER INDUSTRY</b>	
Calender.....	2.0
Cracker, Plasticator.....	2.5
Extruder.....	1.75
Intensive or Banbury Mixer.....	2.5
Mixing Mill, Refiner or Sheeter	
One or two in line.....	2.5
Three or four in line.....	2.0
Five or more in line.....	1.75
Tire Building Machine.....	2.5
Tire & Tube Press Opener	
(Peak Torque).....	1.0
Tuber, Strainer, Pellitizer.....	1.75
Warming Mill	
One or two Mills in line.....	2.0
Three or more Mills in line.....	1.75
Washer.....	2.5
<b>SEWAGE DISPOSAL EQUIPMENT</b>	
Bar Screen, Chemical Feeders,	
Collectors, Dewatering	
Screen, Grit Collector.....	1.0
<b>SUGAR INDUSTRY</b>	
Cane Carrier & Leveler.....	1.75
Cane Knife & Crusher.....	2.0
Mill Stands, Turbine Driver	
With all helical or	
Herringbone gears.....	1.5
Electric Drive or Steam Engine	
Drive with Helical,	
Herringbone, or Spur Gears	
with any Prime Mover.....	1.75
<b>TEXTILE INDUSTRY</b>	
Batcher.....	1.25
Calender, Card Machine.....	1.5
Cloth Finishing Machine.....	1.5
Dry Can, Loom.....	1.5
Dyeing Machinery.....	1.25
Knitting Machine..... Refer to Factory	
Mangle, Napper, Soaper.....	1.25
Spinner, Tenter Frame, Winder.....	1.5

SERVICE FACTORS are a guide, based on experience, of the ratio between coupling catalog rating and system characteristics. The system characteristics are best measured with a torque meter.

Torque Demands Driven Machine	Typical applications for electric motor or turbine driven equipment	Typical Service Factor
	Constant Torque such as Centrifugal Pumps, Blowers, and Compressors.	1.0
	Continuous duty with some torque variations including Plastic Extruders, Forced Draft Fans.	1.5
	Light shock loads from Metal Extruders, Cooling Towers, Cane Knife, Log Haul.	2.0
	Moderate shock loading as expected from a Car Dumper, Stone Crusher, Vibrating Screen.	2.5
	Heavy shock load with some negative torques from Roughing Mills, Reciprocating Pumps, Compressors, Reversing Runout Tables,	3.0
	Applications like Reciprocating Compressors with frequent torque reversals, which do not necessarily cause reverse rotations.	Consult Rexnord Engineering

# How to Order

The following information is necessary to quote or ship to your exact requirements. Prompt service is assured if this information is given on your inquiry or order.

- Application: Driver & Driven
- Power: Normal kW, Maximum kW or Torque (Nm)
- Speed (RPM)
- For Type T63 Disc Brake Couplings, furnish brake requirements.
  - Holding torque requirement.
  - $WR^2$  of rotating parts (at brake location.)
  - Frequency of stops.
  - Rate of deceleration required — desired stop time and stopping rpm.
- Quantity
- Coupling Size and Type e.g., 110T41 or 1070T10
- Shaft Gap or distance between shaft ends (BE Dimension)
- Bore Sizes: Must Specify clearance or interference fit, or fit will be furnished per Table 27, Page 43. Bore sizes will be furnished as per Tables 29 or 30 on Pages 43-45 unless specified differently.
- Shaft Dimensions as follows:

### For Straight Shafts:

Driving Shaft	Driven Shaft
Diameter U _____	Diameter U _____
Tolerance _____	Tolerance _____
Length V _____	Length V _____
Keyway _____	Keyway _____

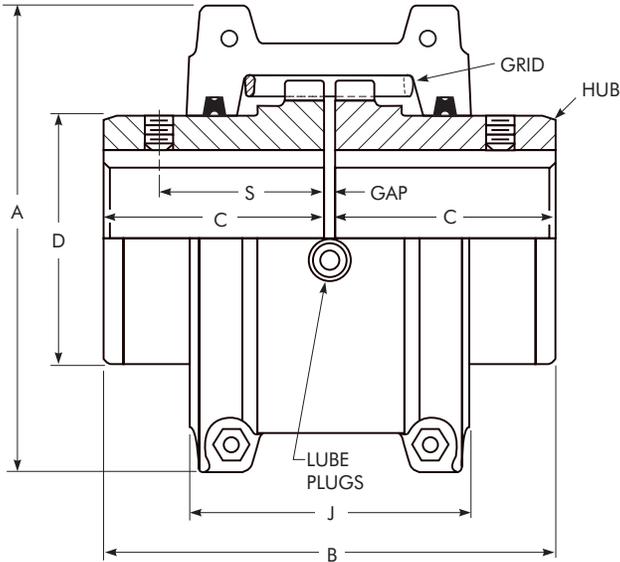

NOTE: Provide shaft tolerances if different than those shown in Tables 28 thru 30, Pages 43-45. Unless otherwise specified, metric keyways will be furnished per ISO/R773-1969 and  $J_5/9$  width tolerances. Keyway sizes in inch shafts will be furnished based on key sizes listed in Table 13, Page 36, to Rexnord tolerances. For other shaft/bore requirements, consult Factory.

### For Taper Shafts: keyway is assumed to be parallel to the bore.

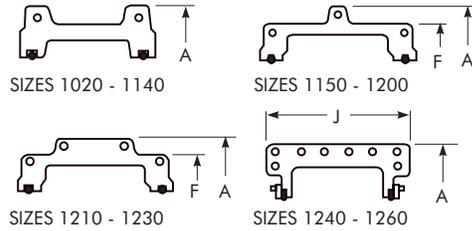

Diameter U _____	Across Flats _____
Length V _____	Corners ZW _____
Length W _____	Taper _____
Length X _____	Keyway _____
Length Y _____	

# Type T10

## Close Coupled/Dimensions — Millimeters

### COVER PROFILES – HORIZONTAL SPLIT

Sizes 1020 thru 1230T10 covers are cast aluminum alloy;  
 Sizes 1240 thru 1260T10 are fabricated steel.

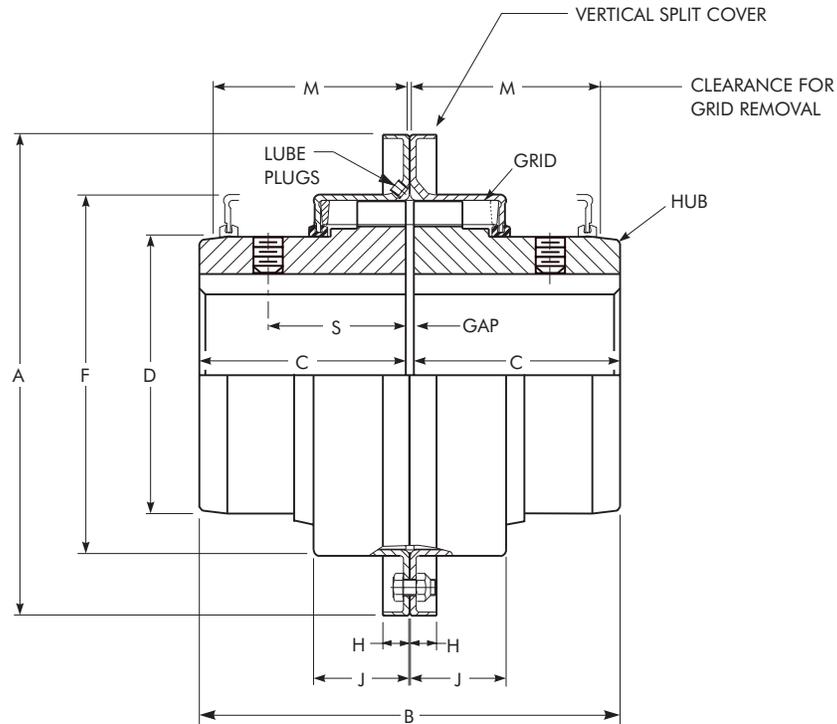

Type HD size range is from 1070-1140 as shown in screens below. Covers are powder-coated and seals are Nitrile.

★ Refer to Page 5 for General Information and Reference Notes. Use a coupling guard that will permit air to circulate and cool the coupling. Gap is 3 mm for Sizes 1020T thru 1090T; 5 mm for Sizes 1100T & 1110T and 6 mm for Sizes 1120T thru 1200T.  
 ♦ Weights are for couplings with Dimension C and W length hubs.  
 \* Dimension shown is for Type T41. Type T41-2=88,9 mm.  
 ▲ To remove cover without disturbing torque setting, allow M clearance.  
 ♣ With new friction segments.

♠ Refer to Tables 15 & 17 for maximum bores with square or rectangular keys.

# Types T44 & T44-2

# Types T45

## Piloted Controlled Torque Assemblies

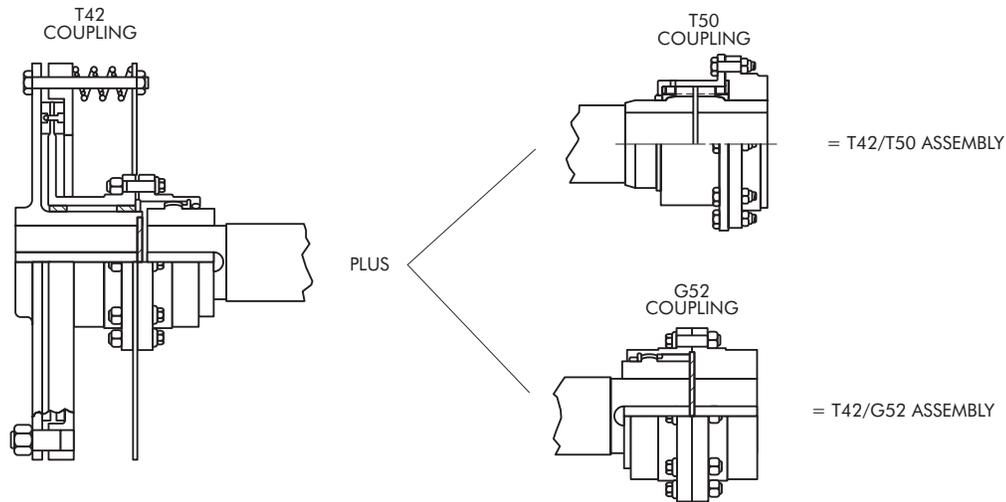

A T45 coupling is a hybrid T41/T50 assembly. It provides the shock dampening of a Steelflex grid coupling in a piloted design for floating shafts with a controlled torque feature for overload protection.

# Types T42

## Piloted Controlled Torque Assemblies

A T42 coupling is also a hybrid. It is a T41 controlled torque assembly mated to a standard flex half gear coupling. This arrangement provides for high torques and a torsionally stiffer assembly with overload protection.

Either the T45 or T42 coupling can be used with a T50 or G52 coupling on the opposite end of the floating shaft to achieve different operational characteristics or preferences for grid or gear couplings.

# Optional Automatic Proximity Sensor Cutout Switch

An automatic proximity cutout switch in the motor starter control circuit of controlled torque coupling or clutch application is recommended for protection of connected equipment and coupling or clutch where damaging thermal buildup could develop. Refer to Slip Torque Performance Charts on Pages 24 through 27 to determine if an automatic proximity sensor cutout switch is required.

The proximity cutout switch speed control is adjustable at the control box. It is set at a required cutout speed and continually compares the actual speed of the driven shaft with the set cutout speed. The control box can be mounted in an approximate space of 76,2 millimeters wide by 76,2 millimeters deep by 127,0 millimeters high.

During overload, the coupling or clutch slips at a predetermined speed. When the driven shaft speed drops below the cutout switch speed setting, it opens the motor circuit and the drag load stops the motor shaft.

When the underspeed cutout switch is wired for automatic reset, the drive is immediately ready for service (after overload is removed) without resetting the circuit at any point. To restart the drive, just press either the main or remote control start button. The motor will not maintain normal operation if the overload has not been removed because the motor contractor circuit will reopen as soon as the start button is released.

The customer may incorporate a warning light or an alarm to the circuit to signal the operator of an overload or shutdown condition.

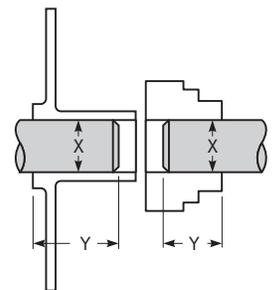

Refer to Service Manual 428-440 for complete details.

## Overhanging Hubs

When the distance between shaft ends is greater than the Coupling gap or when the coupling or clutch hub length is greater than the usable shaft length, overhang one or both hubs. For Type T41, if this results in less than one shaft diameter of hub engagement, check key stresses or use a semi-standard long T hub listed in Table 23, Page 42 or submit application details to Falk.

**CAUTION:** The effect of open keyways on coupling or clutch balance should always be considered.

Dimension Y must be equal to or greater than dimension X for clearance fits, or greater than Dimension X times .75 for interference fits.

# Slip Torque Performance Charts

The following charts are for LT, T41, T41-2, T44 and T44-2 couplings or clutches. The coupling or clutch slip torque setting and operating speed determine the length of time a coupling or clutch can slip without exceeding its thermal capacity. An automatic cutout switch (see Page 21) is REQUIRED on applications as indicated in the upper right of the charts (Footnote 1) and is recommended on applications where "minutes of slip and non-slip" are exceeded.

**CAUTION:** Thermal conditions in the slip torque performance charts apply only when the controlled torque hub is mounted on the driving shaft. When the controlled torque hub is mounted on the driven shaft reduce the slip time by 50%.

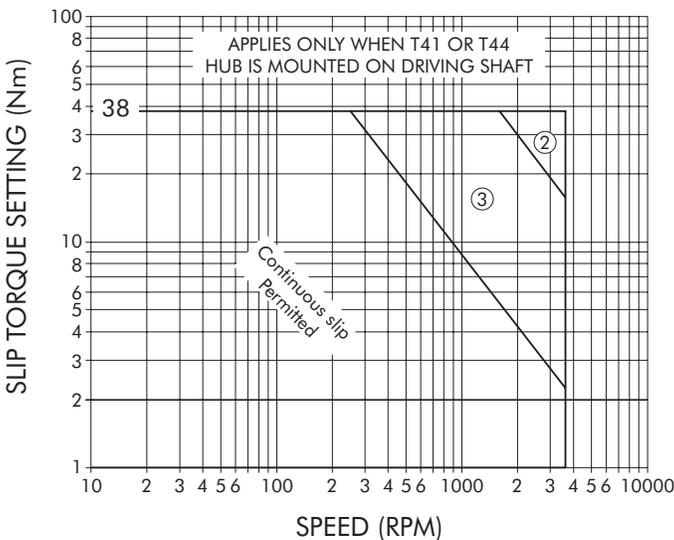

During slip, heat is generated at the friction lining surfaces. The following charts specify the thermal capacities. When the torque (slip torque at the slip speed — not motor horsepower) being

dissipated during a slip period exceeds the thermal capacity of the coupling or clutch, the following conditions will result:

1. Lining wear will change the coefficient of friction and slip torque setting.
2. Excessive sleeve bearing wear.
3. Warping of controlled torque hub flange and drive plate flange.
4. Heavy smoke and possibly fire.
5. Complete coupling or clutch failure.

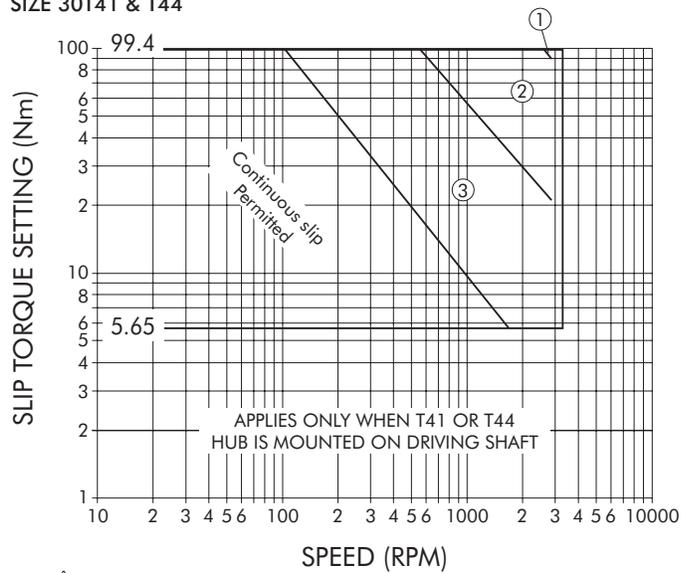

The limits specified in these charts must be adhered to for proper operation of controlled torque couplings or clutches in overload systems. Refer to the Factory all applications requiring operation beyond the coupling or clutch thermal capacity.

# Type T50

## Floating Shaft/Selections

**Introduction** — Floating shaft diameters have been preselected to transmit the coupling torque and need only to be checked for allowable speed.

**Construction** — Standard shafts are solid, AISI 1018 or 1020 cold rolled steel. Also available is an optional solid, AISI 1018, fully turned, hot rolled steel shaft.

### Determine the Allowable Shaft Length

- Select the coupling size per Pages 9 and 28.
- From Page 28, determine shaft diameter (Dimension SD) for the coupling selected.
- From the table below, locate the floating shaft diameter (Dimension SD) determined in Step B.

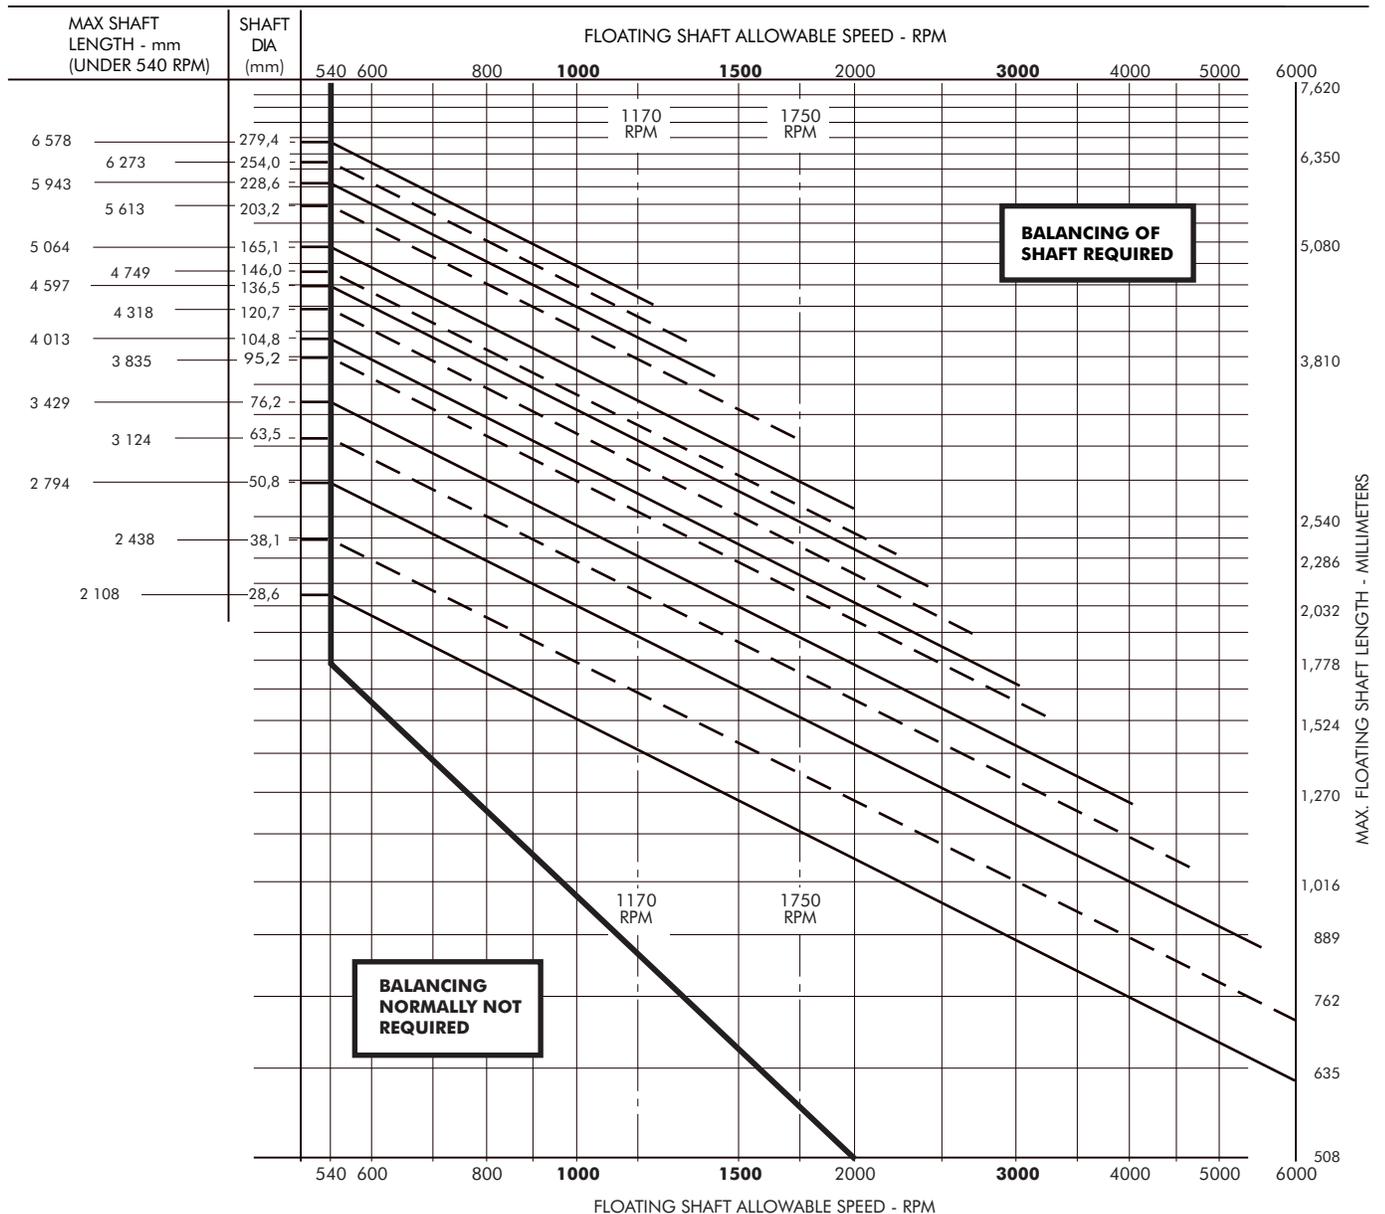

- Determine the allowable shaft length for the required operating speed.

For Speeds under 540 rpm — Read the maximum allowable shaft length to the left of the required shaft diameter.

For Speeds over 540 rpm — Trace right from the shaft diameter determined along the diagonal line to the point of intersection with the required vertical operating speed line. Trace right along the horizontal line to the right and read the maximum allowable shaft length.

- Determine if shaft requires balancing. Locate point where operating speed and floating shaft length cross. Balance is required when point is located to the right of bold line.
- If a longer shaft is required, reduce the operating speed if practical, or select the next larger size coupling. Note: For such conditions, the use of a tubular shaft design should be considered, refer application details to the local Rexnord Representative.

**TABLE 12 — Floating Shaft Selections**

# Caliper Disc Brake System

Rexnord will supply Type T63 Disc Couplings for use with calipers and power systems by others, or a fail-safe Caliper Disc Brake System. The system is comprised of a Falk Steelflex Coupling, caliper disc brake, basic hydraulic circuits and components. These systems are designed to be used as parking or holding brakes, or limited usage dynamic stopping brakes.

Rexnord will purchase for resale the caliper disc brakes and hydraulic components preassembled in a power package.

Rexnord can assemble or mount the T63 coupling, disc brake, and hydraulic system when these components are ordered in conjunction with Falk gear drives.

## Capabilities

The Falk Steelflex Disc Brake Coupling with Caliper Brake System has an assigned coupling brake rating range of 11 to 16 938 Nm.

## Description of the Disc Brake Coupling and Caliper System

The system consists of a standard T63 coupling using disc diameter and thickness compatible with one caliper brake manufacturer. Both MICO-Minnesota Automotive Inc., and Goodyear Aerospace Corporation caliper disc brakes are used on Sizes 50T63 through 120T63 and 130T63, respectively. Both caliper manufacturers use different mounting hole patterns and bracket styles. MICO and Goodyear caliper disc brakes require hydraulic pressure.

## Caliper Disc Brakes

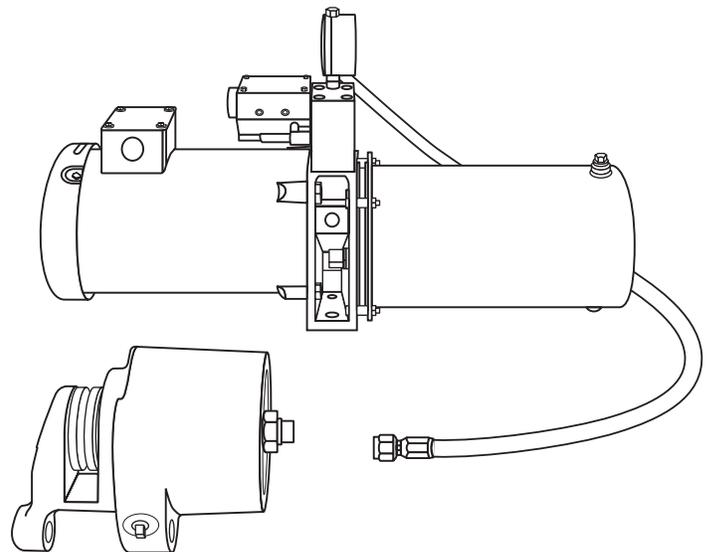

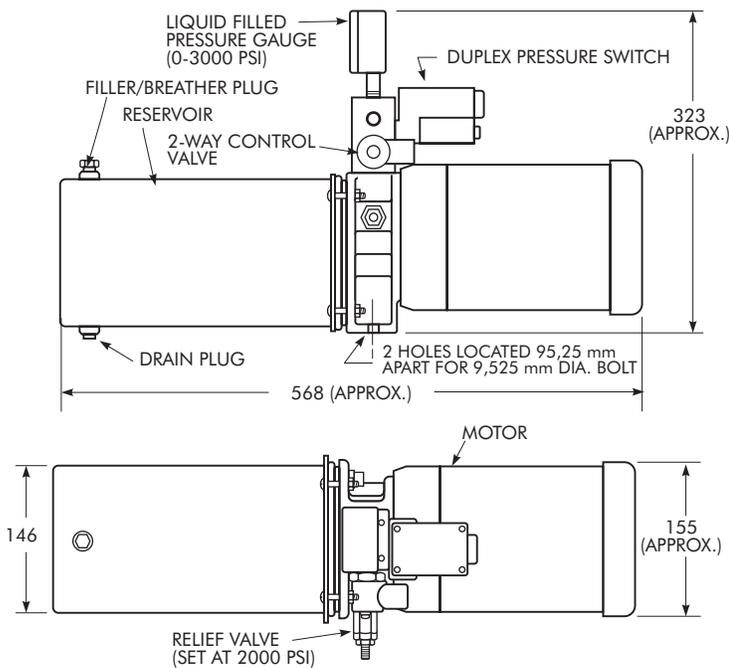

The caliper disc brake is spring loaded to apply the brake. Hydraulic pressure is required to release or "hold off" the brake. Normal operation is to have the brake pressurized in the released position with the hydraulic system running. Conditions such as an electric power or pressure system failure, which reduces the system pressure below the release pressure of the brake, will initiate a brake application.

## Hydraulic Brake System

The system consist of an oil tank, filter, gear pump and electric motor, relief valve, check valve, solenoid direction control valve, pressure gauge, duplex pressure switch, 1.52 meter hydraulic hose with connections and caliper disc brake.

## Operation

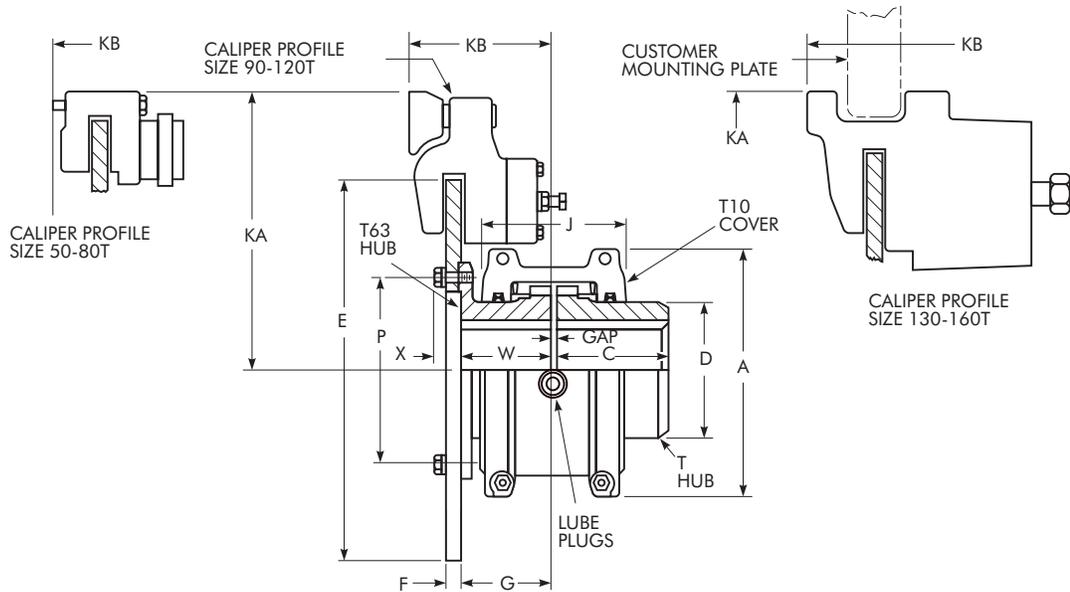

The hydraulic brake system is actuated by turning on its electric motor. The motor drives a gear pump which produces a flow of oil between pump and solenoid directional control valve. When the solenoid directional control valve is energized, oil pressure rises in the caliper brake compressing the belleville springs to apply the brake.

# Type T63

## Disc Brake/Dimensions — Millimeters

**NOTE:** Falk Type T63 couplings or brake assemblies are not approved as a primary brake for applications used to lift or transport people such as elevators, escalators, hoists, lifts, etc.

★ Refer to Page 5 for General Information and Reference Notes.

◆ Couplings will be furnished for INTERFERENCE FIT without a set screw. Clearance fit and/or hubs with set screws are not recommended. Rexnord standards apply unless otherwise specified. Maximum bores listed are based on recommended keys shown in Table 13, Page 36. For other maximum bore-key combinations that can be manufactured to order, refer to Table 15 on Page 37.

\* Refer to the Factory for discs with dimensions other than shown.

# Type T63

- ♦ These brakes use hydraulic oil (NOT brake fluid). Any high grade hydraulic oil with viscosities of 150 SSU-350 SSU @ 38°C is suitable.
- ▲ Maximum torque shown is rating with new pads. Minimum torque shown is rating at point when caliper requires adjustment for pad wear.
- ♣ dimension KB is to caliper mounting surface for Coupling Sizes 50T thru 120T, and to caliper edge for Coupling Sizes 130T and larger.

# Type T90

## Engine Flywheel Adapter/Dimensions — Millimeters

Used primarily to connect the flywheel of an engine to the driven machinery. Adapter plates are designed to accommodate standard SAE J620 bolt patterns. The T90 design provides for higher torque ratings with resulting smaller sizes and lower costs than elastomer coupling designs. The flexible gridmember provides torsional damping in addition to accepting misalignment. Adapter plates are bolted and doweled to the hub to provide a secure joint.

**Selection** — Determine the proper Steelflex coupling size using the selection method. Check size selected against those shown in table below for the clutch size used on the engine flywheel. If the coupling size is not shown, refer all details to the Factory.

**OVERHANGING HUBS** — Hubs may be overhung on the shafting provided there is more than one shaft diameter of hub/shaft engagement for clearance fits, or more than 3/4 times shaft diameter hub/shaft engagement for interference fits. If hub engagement is less than what is required, use a standard long hub listed in Table 23 on Page 42, or submit application details to the Factory.

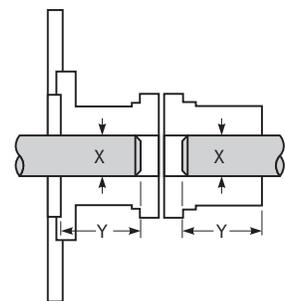

Dimension L must be equal to or greater than Dimension SD for clearance fits, or greater than Dimension SD times .75 for interference fits. For Type T63, Dimension Y must be equal to or greater than Dimension X.

**Example:** SD = 100 mm; then L must be 100 mm or more for clearance fits or 75 mm or more for interference fits.

**CAUTION:** The effect of open keyways on coupling balance should always be considered.

**Example – Type T, Other than T63**

**Example – Type T63**

- ★ Refer to Page 5 for general information and Reference Notes.
- Metric keyways and keyway radii will be furnished per ISO/R773 (DIN 6885/1) and Js9 width tolerances unless otherwise specified. P9 and D10 width tolerance can be furnished on request. Refer to 427-140 for tolerances.
- Shaded areas indicate maximum bores using standard recommended keys shown on Table 13.
- ♦ Unless otherwise specified, Sizes 1020 thru 1090 will be furnished for CLEARANCE FIT with a setscrew OVER the keyway and Sizes 1100 and larger will be furnished for INTERFERENCE FIT without a setscrew. EXCEPTION: for Types T50 and T70, coupling hubs are normally furnished with an average INTERFERENCE FIT of 0,0005 mm per millimeter of shaft diameter. Clearance fit and/or hubs with setscrews are not recommended.
- \* Shaft keyway depth Y equals one-half of square key W. CHECK KEY STRESSES.
- ▲ Also applies to Hub Type T61, T63, T50 pilot hub and flanged hub of T50 and T70 type couplings.
- ♣ With standard puller bolt holes per Tables 24 and 25, Page 42.
- ▼ Consult the Factory.

★ Refer to footnotes from Table 15 and to Page 5 for General Information and Reference Notes. Unless otherwise specified, Sizes 1020 thru 1090 will be furnished for CLEARANCE Fit with a setscrew OVER the keyway and sizes 1100 and larger will be furnished for INTERFERENCE FIT without a setscrew.

♦ Maximum bore with optional square key

\* A special rectangular key is required.

■ Shaded areas indicate maximum bores using standard recommended keys shown on Table 13.

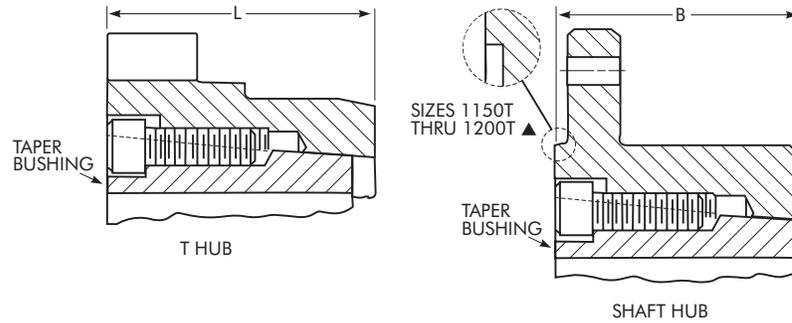

§ Interference fit is not recommended.

♦ Use straight bored hubs for shock load or reversing load applications or applications that require 1.75 or higher coupling service factors or refer to the Factory for selection, price and delivery of special bushings. Refer to the Factory for selection of taper-lock bushings for Type T50 and T70 couplings.

\* Bushings require shaft keyways per ISO R773.

▲ For Sizes 1150T thru 1200T, dimension "B" is to the hub counterbore.

♦ Values shown are for standard hub lengths.

## Coupling Misalignment

Maximum life and minimum maintenance for the coupling and connected machinery will result if couplings are accurately aligned. Coupling life expectancy between initial alignment and maximum operating limits is a function of load, speed and lubrication. For applications requiring greater misalignment, refer application details to the Factory.

**Angular misalignment** is expressed in degrees and as the difference between the value of X minus Y, as illustrated.

**Parallel misalignment** is the distance P between shaft center lines as shown.

**TABLE 21— Type T Steelflex Coupling Misalignment Capacity — Millimeters ★**

CPG SIZE	Recommended Installation Maximum				Maximum Operating			Normal Gap ± 10%

◆ Coupling selections are based on coupling bore capacity and standard available hub lengths. Check coupling rating for all selections, and hub key stress for mill motor selections 620 and larger.

# Engineering Data

Table 23 specifies the taper and counter bore limitations for the usual requirements. Refer applications for counter bore diameters or depths which exceed any of these limitations, and requirements for hubs longer than those listed, to the Factory with full particulars for review.

Type T Hub or T31/T35 Shaft Hubs Only. ♦

♣ Locate puller bolt holes 90° from keyway except as noted by Footnote ♥.

♥ Drill and tap thru flange between existing holes. Relation to keyway may vary freely.

**Footnotes for Table 26**

♦ 1000T series information also applies to 10T series, e.g., 1020=20.

§ Also applies to hub Types T61, T63, T50 pilot hub and flanged hub of Types T50 & T70 couplings.

\* Interference fit is not recommended.

♦ For shaft diameters larger than 20.000, use an average interference fit of .0005" per inch of shaft diameter with the following bore tolerances:  
 +.003, -.000 for over 20 to 30 dia. incl.  
 +.004, -.000 for over 30 to 40 dia. incl.  
 Tolerances and fits comply with, or are within, AGMA 9002-A86 standard (class 1 clearance fit).

# World Class Customer Service

For more than 100 years, the dedicated people of Rexnord have delivered excellence in quality and service to our customers around the globe. Rexnord is a trusted name when it comes to providing skillfully engineered products that improve productivity and efficiency for industrial applications worldwide. We are committed to exceeding customer expectations in every area of our business: product design, application engineering, operations, and customer service.

Because of our customer focus, we are able to thoroughly understand the needs of your business and have the resources available to work closely with you to reduce maintenance costs, eliminate redundant inventories and prevent equipment down time.

Rexnord represents the most comprehensive portfolio of power transmission and conveying components in the world with the brands you know and trust.

UltraMax and Rexnord are registered trademarks of Rexnord Industries, LLC. Viton is a registered trademark of DuPont. Falk is a trademark of Rexnord. All rights reserved.
