SCAR TREATMENT AFTER C-SECTION

If you have given birth by Caesarian Section, either by choice or as a result of medical necessity, the resulting abdominal wound will leave a scar after it heals. Scarban® C-Section silicone sheets ensure that scar formation is minimised.

WHAT IS A SCAR?

After an operation, your body does everything it can to repair the damaged skin as quickly as possible. Unfortunately, damaged skin loses much more moisture than healthy skin.

Your body reacts to this moisture loss with a 'panic' reaction. It creates more connective tissue to strengthen the damaged skin. In other words, it creates a scar. In many cases the scar may be clearly visible, red and thickened (i.e. hypertrophic or keloid).

It is not possible to predict whether or when your body may develop an abnormal (hypertrophic or keloid) scar. This depends on several factors. However, as explained earlier, one of the most important causes is excessive moisture loss from within the scar.

Something you can help prevent by taking the right measures.

Scarban supports scar recovery

The silicone sheets help prevent abnormal (hypertrophic or keloid) scarring

HOW DOES SCARBAN WORK?

Scarban® C-Section silicone sheets care for your scar. Simply put, Scarban® reduces moisture loss from the scar. Your body stops its 'panic' reaction and the scar 'relaxes'. Early application of Scarban® C-Section supports fast recovery of the scar and helps prevent abnormal (hypertrophic or keloid) scarring.

Faster recovery will make your scar:

- **Flatter** Less elevated / thickened
- **More flexible** Less painful, with less skin tension
- **Less reddened** Less visible

RECOMMENDED BY SPECIALISTS

(Skin) professionals worldwide strongly advise the use of Scarban® silicone therapy.

Professionals choose Scarban® silicone sheets because of its:

- **Quality** Scarban® contains 100% medical grade silicone
- **Comfort** The silicone sheets feel extremely soft and comfortable, thanks to the elastic top fabric layer
- **Durability** The silicone sheets are washable and last for a long time, without losing adhesion

Scarban reduces symptoms
such as itching, pain and redness

CLINICALLY PROVEN

You can rely on the effectiveness of Scarban® silicone sheets. The effectiveness of silicone and Scarban® has been proven clinically and scientifically.¹

This makes silicone therapy one of the few, clinically proven methods for effective reduction of both abnormal scar formation and existing scars. Not surprisingly, silicone therapy is mentioned as the preferred non-invasive therapy in all current International Scar Management guidelines.²⁻⁴

ADDITIONAL UV PROTECTION

The International Scar Management guidelines are very clear: damaged skin must be kept out of the sun.^{2,3}

When exposed to the sun, your scar is at risk for:

- **Sunburn** Scars get easily sunburnt
- **Permanent discolouration** Scars become darker

Scarban® offers very high UV protection (UPF 50) thereby providing optimum protection from the sun for vulnerable scars in normal daily activities.

We advise to avoid excessive sun exposure of your scar. However in the occasion that your scar is exposed, be assured that Scarban® provides adequate protection.

Research has shown

that after an operation, there is a 50% chance that a scar will become hypertrophic.⁵ Which is why every scar needs care!
