Introduction

If you plan to integrate a “tracker”, please take a look at “GpsGate TrackerOne” described in http://franson.com/gpsgateserver/GpsGateTrackerOne.pdf

This document describes communication to GpsGate Server using GpsGate Protocol. The main purpose is position updates, status messaging, track reports and configuration. Software and hardware developers are encouraged to use this protocol to integrate with GpsGate.com and GpsGate Server.

Communication can be made over TCP/IP, UDP, HTTP, SMS and XML/HTTP. Full functionality is achieved over TCP/IP.

The protocol can be used with GpsGate Server and GpsGate.com. The address to GpsGate.com is online.gpsgate.com port 30175, port 80 for HTTP and port 8008 for XML/HTTP

All sentences should always be followed by a NMEA checksum and carriage return + line feed “\r\n”. See Appendix 1 for an example algorithm to calculate the checksum.

GpsGate Server also supports JSON & XML/SOAP based web services which aren't covered in this document. Please read more here: http://gpsgate.com/index.php?id=47

For help please visit our forum – http://franson.com/forum – or contact support@franson.com

Login commands

This section contains information on login commands. This includes both commands sent from client to server and possible server replies.

Login with username and password

**Syntax:**

```
$FRLIN, domain, username, password*XX
```

<table>
<thead>
<tr>
<th>domain</th>
<th>Always empty. Reserved for future use.</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>The GpsGate.com / Server username</td>
</tr>
<tr>
<td>Password</td>
<td>Password with a very simple encryption. Algorithm is described in Appendix 2</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA checksum. Algorithm to calculate shown in Appendix 1</td>
</tr>
</tbody>
</table>

**Sample sentence:**

```
$FRLIN,,user1,8IVHF*7A
```

Login with hardware IMEI number

**Syntax:**

```
$FRLIN,domain,username,password*XX
```

<table>
<thead>
<tr>
<th>domain</th>
<th>should be the string &quot;IMEI&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>the device IMEI number e.g. 1234123412341324</td>
</tr>
<tr>
<td>password</td>
<td>always empty</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA checksum. Algorithm to calculate shown in Appendix 1</td>
</tr>
</tbody>
</table>

**Sample sentence:**

```
$FRLIN,IMEI,1234123412341234,*7A
```

You need to create a device in the GpsGate Web interface for a specific user. This will connect a user to an IMEI number.

Successful login message

This message is returned from server on a successful login.

**Syntax:**

```
$FRSES,sessionid*XX
```

<table>
<thead>
<tr>
<th>sessionid</th>
<th>Server side session id.</th>
</tr>
</thead>
<tbody>
<tr>
<td>XX</td>
<td>NMEA checksum. Algorithm to calculate shown in Appendix 1</td>
</tr>
</tbody>
</table>

Copyright Franson Technology AB, 2009
**Sample sentence:**

$FRSES,1221568*46

**Error message**

Error message. Will be returned from server on failed login. The server can also simply close the connection if some kind of error or time-out condition occur.

**Syntax:**

$FRERR, err_code, err_message*XX

<table>
<thead>
<tr>
<th>err_code</th>
<th>Currently only value is &quot;AuthError&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>err_message</td>
<td>Human readable error message</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA checksum. Algorithm to calculate shown in Appendix 1</td>
</tr>
</tbody>
</table>

**Sample sentence:**

$FRERR, AuthError, You have provided wrong username or password*18

**Position data messages**

**User position request**

Used to request position data from another user in requesting users buddy list. Position data is sent as GPRMC sentences from server.

**Syntax:**

$FRRDT, username, interval*XX

<table>
<thead>
<tr>
<th>username</th>
<th>The username in the buddy list to receive position data from. Or &quot;_buddies&quot; to get data from all the users buddies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interval</td>
<td>in seconds. Can have decimals. 0 = receive all data unfiltered.</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA checksum. Algorithm to calculate shown in Appendix 1</td>
</tr>
</tbody>
</table>

Username can be either one user or the buddy list. Depending on the value of “username” the following actions are taken:

**One user:** An GPRMC sentence is sent right away from server with latest known position, and the UTC time when that position was reported.

"_buddies": An FRPOS sentence is sent right away from server for each user with known position with latest known position, and the UTC time when that position was reported.

**Notes:**

Data is not sent back to the client faster than the interval specified.

Data is not sent if the position hasn't been updated.

If there is any error, the socket is closed.
User position update request

Sent from client that wants to write position data to the server. This is the same thing as adding a "GpsGate.com (Send)" plugin to GpsGate Outputs.

**Syntax:**

\$FRNDT,datatype*XX

<table>
<thead>
<tr>
<th>datatype</th>
<th>Can be &quot;ALL&quot; or &quot;NMEA&quot;. If ALL, then all data will be passed through unfiltered. If NMEA only $GPRMC data is accepted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>XX</td>
<td>NMEA checksum. Algorithm to calculate shown in Appendix 1</td>
</tr>
</tbody>
</table>

**Sample sentence:**

\$FRNDT,NMEA*78

Position update - FRPOS

Received from server if positions from ".buddies" are requested.

**Syntax:**

\$FRPOS,DDMM.mmmm,N,DDMM.mmmm,E,AA.a,SSS.ss,HHH.h,DDMMYY,hhmms.s.dd,buddy*XX

| 01 | DDMM.mmmm | Latitude (NMEA format) |
| 02 | <N|S> | Hemisphere N or S |
| 03 | DDMM.mmmm | Longitude DDMM.mmmm (NMEA format) |
| 04 | <E|W> | Hemisphere E or W |
| 05 | AA.a | Altitude in meters above sea level |
| 06 | SSS.ss | Speed over ground in knots |
| 07 | HHH.h | Heading over ground in degrees |
| 08 | DDMMYY | date |
| 09 | hhmms.dd | Time (UTC) |
| 10 | buddy | name of buddy this position info belongs to. |
| 11 | XX | NMEA checksum. Algorithm to calculate shown in Appendix 1 |

**Sample sentence:**

\$FRPOS,6311.64120,N,01438.02740,E,0.0,0.000,0.0,270707,154403.000,Johan*18

Copyright Franson Technology AB, 2009
Position update - GPRMC

The position information sentence is used both to send and receive updates. It is received from server when requesting updates for a single user. It is sent to server when updating position for a single user.

Syntax:

$GPRMC,hhmmss.dd,A,DDMM.mmmm,N,DDMM.mmmm,E,SSS.ss,HHH.h,DDMMYY,,*0A

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>hhmmss.dd</td>
</tr>
<tr>
<td>02</td>
<td>&lt;A</td>
</tr>
<tr>
<td>03</td>
<td>DDMM.mmmm</td>
</tr>
<tr>
<td>04</td>
<td>&lt;N</td>
</tr>
<tr>
<td>05</td>
<td>DDMM.mmmm</td>
</tr>
<tr>
<td>06</td>
<td>&lt;E</td>
</tr>
<tr>
<td>07</td>
<td>SSS.ss</td>
</tr>
<tr>
<td>08</td>
<td>HHH.h</td>
</tr>
<tr>
<td>09</td>
<td>DDMMYY</td>
</tr>
<tr>
<td>10</td>
<td>RMC_MagVarDir</td>
</tr>
<tr>
<td>11</td>
<td>XX</td>
</tr>
</tbody>
</table>

Sample sentence:

$GPRMC,154403.000,A,6311.64120,N,01438.02740,E,0.000,0.0,270707,,*0A

Sample scenarios with TCP/IP

Connect to online.gpsgate.com port 30175, or to your own GpsGate Server installation to test the examples.

Scenario: Failed login

The following scenario shows a user that tries to login using the wrong user name or password.

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>FRLIN</td>
<td>FRERR</td>
</tr>
</tbody>
</table>

Same scenario with real sample data:

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRLIN,,user1,HHVMOLLX*5F</td>
<td>$FRERR,AuthError,You have provided wrong username or password*18</td>
</tr>
</tbody>
</table>

Note: If the checksum is wrong, there will be no response at all from the server.

Copyright Franson Technology AB, 2009
Scenario: Receive data from the server for one user

The following scenario shows the flow when a user connects to the server and starts receiving position updates for one user.

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>FRLIN</td>
<td>FRSES</td>
</tr>
<tr>
<td>FRRDT</td>
<td>GPRMC</td>
</tr>
<tr>
<td></td>
<td>GPRMC</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
</tbody>
</table>

Same scenario with real sample data

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRLIN,,user1,8IVHF*7A</td>
<td>$FRSES,1221568*46</td>
</tr>
<tr>
<td>$FRRDT,johan,10.0*2B</td>
<td>$GPRMC,154403.000,A,6311.64120,N,01438.02740,E,0.000,0.0,270707,*,*0A</td>
</tr>
</tbody>
</table>

New GPRMC sentences will be sent from server when user "johan" updates his position, but not more often than every 10 seconds as specified in the second field of FRRDT. In this example user "user1" receives data from user "johan". You can also read data from the same user that logs in.

Scenario: Get data from all users in buddy list

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>FRLIN</td>
<td>FRSES</td>
</tr>
<tr>
<td>FRRDT</td>
<td>FRPOS</td>
</tr>
<tr>
<td></td>
<td>FRPOS</td>
</tr>
<tr>
<td></td>
<td>...</td>
</tr>
</tbody>
</table>

Same scenario with real sample data

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRLIN,,user1,8IVHF*7A</td>
<td>$FRSES,1221640*4F</td>
</tr>
<tr>
<td>$FRRDT,_buddies,10.0*7E</td>
<td>$FRPOS,6311.64120,N,01438.02740,E,0.0,0.000,0.0,270707,154403.000,Johan*18</td>
</tr>
<tr>
<td>$FRRDT,_buddies,10.0*7E</td>
<td>$FRPOS,5920.714511,N,01803.28481,E,0.0,0.000,0.0,222402.880,user1*50</td>
</tr>
</tbody>
</table>

New FRPOS sentences will be sent from server as users in your buddy list update their positions, but not more often than every 10 seconds as specified in the second field of FRRDT.

Copyright Franson Technology AB, 2009
Scenario: Write data to server

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>FRLIN</td>
<td>FRSES</td>
</tr>
<tr>
<td>FRWDT</td>
<td></td>
</tr>
<tr>
<td>GPRMC</td>
<td></td>
</tr>
<tr>
<td>GPRMC</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
</tbody>
</table>

Same scenario with real sample data

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRLIN,,user1,8IVHF<em>7A $FRSES,1221640</em>4F</td>
<td></td>
</tr>
<tr>
<td>$FRWDT,NMEA<em>78 $FRWDT,NMEA</em>78</td>
<td></td>
</tr>
<tr>
<td>$GPRMC,154403.000,A,6311.64120,N,01438.02740,E,0.000,0.0,270707,,,*0A $GPRMC,154423.000,A,6311.64143,N,01438.02743,E,0.000,0.0,270707,,,*0C</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

And then keep sending GPRMC data to the server.
If you need altitude information send GGA sentences as well.

Same scenario using IMEI number

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRLIN,IMEI,1234123412341234,<em>7B $FRSES,1221640</em>4F</td>
<td></td>
</tr>
<tr>
<td>$FRWDT,NMEA<em>78 $FRWDT,NMEA</em>78</td>
<td></td>
</tr>
<tr>
<td>$GPRMC,154403.000,A,6311.64120,N,01438.02740,E,0.000,0.0,270707,,,*0A $GPRMC,154423.000,A,6311.64143,N,01438.02743,E,0.000,0.0,270707,,,*0C</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

And then keep sending GPRMC data to the server.

Scenario to write data to server using UDP

You can also send data to over UDP. Send to online.gpsgate.com port 30175, or to your own GpsGate Server installation.

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>FRLIN</td>
<td></td>
</tr>
<tr>
<td>GPRMC</td>
<td></td>
</tr>
</tbody>
</table>

Note: The server will not respond to UDP datagrams.

Copyright Franson Technology AB, 2009
Same scenario with real sample data-

<table>
<thead>
<tr>
<th>Client</th>
<th>$FRLIN,,user1,8IVHF*7A</th>
</tr>
</thead>
<tbody>
<tr>
<td>$GPRMC,154403.000,A,6311.64120,N,01438.02740,E,0.000,0.0,270707,,*0A</td>
<td></td>
</tr>
</tbody>
</table>

Same scenario but login in using IMEI number

<table>
<thead>
<tr>
<th>Client</th>
<th>$FRLIN,IMEI,1234123412341234,*7B</th>
</tr>
</thead>
<tbody>
<tr>
<td>$GPRMC,154403.000,A,6311.64120,N,01438.02740,E,0.000,0.0,270707,,*0A</td>
<td></td>
</tr>
</tbody>
</table>

**HTTP position updates**

GpsGate Server can also receive data in HTTP format. The URL posted will have the following parameters:

longitude=34.2333&latitude=23.2222&altitude=34.0&speed=30.3&heading=234.5&date=20070529&time=123445.234&username=myuser&pw=encryptedpassword

or using IMEI

longitude=34.2333&latitude=23.2222&altitude=34.0&speed=30.3&heading=234.5&date=20070529&time=123445.234&imei=123456789012345

<table>
<thead>
<tr>
<th>longitude</th>
<th>Decimal degrees (WGS84)</th>
</tr>
</thead>
<tbody>
<tr>
<td>latitude</td>
<td>Decimal degrees (WGS84)</td>
</tr>
<tr>
<td>altitude</td>
<td>Above sea level in meters.</td>
</tr>
<tr>
<td>Speed</td>
<td>Speed over ground in knots</td>
</tr>
<tr>
<td>heading</td>
<td>Heading in degrees. 0 is north, 90 is east, 180 is south, 270 is west.</td>
</tr>
<tr>
<td>date</td>
<td>UTC data in the format: YYYYMMDD</td>
</tr>
<tr>
<td>time</td>
<td>UTC time in the format: HHMMSS.sss</td>
</tr>
<tr>
<td>username</td>
<td>The username specified</td>
</tr>
<tr>
<td>pw</td>
<td>The password specified with a simple encryption. The encryption/decryption algorithm can be found in Appendix 2</td>
</tr>
<tr>
<td>imei</td>
<td>Device IMEI number. Replaces username + pw. Available in GpsGate Server 1.2 build 415 and later.</td>
</tr>
</tbody>
</table>

For GpsGate.com the URL is http://online.gpsgate.com/GpsGate.aspx

For a GpsGate Server installation the URL is http://serveraddress/GpsGate.aspx
(where server address is the DNS to the server where GpsGate Server is installed).

Copyright Franson Technology AB, 2009
GpsGate Server Protocol v1.1 Framework

v1.1 of the protocol adds a framework to send commands from client to server, and from server to client.

Note: The client must send a FRVER sentence after it has received FRSES to indicate it supports v1.1

GpsGate Protocol over TCP/IP

Client version notification

Sent by client to server to indicate which version of GpsGate Server protocol it supports.
This sentence is always answered by a similar from the server which contains the server protocol version, the
server name, and the server version.

$FRVER,major,minor,name_and_version*XX

<table>
<thead>
<tr>
<th>major</th>
<th>Major version of the protocol used. Should be 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>minor</td>
<td>Minor version of protocol used. Should be 1</td>
</tr>
<tr>
<td>name_and_version</td>
<td>Name of peer sending this message. E.g. &quot;TestClient 1.0&quot;. This should always be a name followed by a version number.</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA checksum. Algorithm to calculate shown in Appendix 1</td>
</tr>
</tbody>
</table>

Note! Here you should have the real name of your client plus the version number.

Example:

Client                      | Server                               |
----------------------------|--------------------------------------|
$FRLIN,,user1,8IVHF*7A      | $FRSES,1221640*4F                   |
$FRVER,1,1,TestClient 1.0*79 | $FRVER,1,1,GpsGate Server 1.1.0.360*04 |

Command structure

This structure is used when sending messages to execute commands. Messages can be sent from server to client and client to server. Several commands can be executed between client and server in one session.

Command Sentences

Syntax:

$FRCMD,username,command,Nmea,size*XX

<table>
<thead>
<tr>
<th>username</th>
<th>The logged in user. This field can be empty.</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>the command to be executed. E.g. &quot;_getupdaterules&quot;</td>
</tr>
<tr>
<td>Nmea</td>
<td>&quot;Nmea&quot; if one or more NMEA sentences follows as arguments to command.</td>
</tr>
<tr>
<td>size</td>
<td>Number of NMEA sentences following.</td>
</tr>
</tbody>
</table>

Copyright Franson Technology AB, 2009
Syntax:
$FRCMD,username,command,Inline,param1,param2,...,paramN*XX

username | The logged in user. This field can be empty.
command | the command to be executed. E.g. "_getupdaterules"
Inline | indicates that the rest of the fields in the sentence are arguments to the command.
param1 - N | Parameters to the command
XX | NMEA checksum. Algorithm to calculate shown in Appendix 1

Example:
$FRCMD,,_getupdaterules,Inline*1E

Return values
A return value is sent as a reply to an executed command.

Syntax:
$FRRET,username,command,Nmea,size*XX

username | User which executed the original FRCMD to which this is an answer.
command | The command to which this is an answer.
Nmea | "Nmea" if one or more NMEA sentences follows as arguments to command.
size | Number of NMEA sentences following.
XX | NMEA checksum. Algorithm to calculate shown in Appendix 1

Example:
$FRRET,Johan,_getupdaterules,Nmea,4*43
$FRVAL,DistanceFilter,500.0*67
$FRVAL,TimeFilter,60.0*42
$FRVAL,DirectionFilter,40.0*30
$FRVAL,DirectionThreshold,10.0*42

or

Syntax:
$FRCMD,username,command,Inline,param1,param2,...,paramN*XX

Copyright Franson Technology AB, 2009
The logged in user. This field can be empty.

The command to be executed. E.g. "/getupdaterules"

indicates that the rest of the fields in the sentence are arguments to the command.

Parameters to the command

NMEA checksum. Algorithm to calculate shown in Appendix 1

Command Variables

Sentence which holds a variable. Is typically used in combination with FRCMD and FRRET

**Syntax:**

\[$\text{FRVAL}, \text{name}, \text{value}\ast \text{XX}$

<table>
<thead>
<tr>
<th>name</th>
<th>Name of variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value of variable.</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA checksum. Algorithm to calculate shown in Appendix 1</td>
</tr>
</tbody>
</table>

**Example:**

\[$\text{FRVAL, DistanceFilter, 500.0}\ast \text{67}$

**Error handling**

If a command for some reason cannot be executed FRERR is returned and not FRRET. The reason can be that the there is some kind of execution error, the command is not supported, or there is a protocol error. When FRERR is returned the client should assume no data has been affected on the server. The protocol is transaction based.

In all cases expect when there is a protocol or connection error the exchange of commands can continue between the server and the client.

**Interrupted commands**

If several FRCMD is sent without the previous one being finished, the peer executing the command should roll back the current command and start executing the new command. Example: If two FRCMD is received in a row, the last FRCMD should be executed.

**Failed to execute command**

If a FRCMD fails to execute a FRERR sentence with code “CannotExecute” is returned. The client is free to execute a new command after receiving FRERR.

**Sample communication:**

If the client tries to save data to a track recorder which doesn't belong to the logged in user.

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\text{FRCMD,_SaveTrackData,Nmea,2,2}\ast \text{54}$</td>
<td>$\text{FRERR, CannotExecute, TrackRecorder not}$</td>
</tr>
</tbody>
</table>

Copyright Franson Technology AB, 2009
Command not supported

A client or server that implements v1.1 of the GpsGate protocol does not need to implement any of the
commands (see blow for a list of supported commands) described in this document. For commands that aren't
supported a FRERR with code “NotSupported”. The client is free to execute a new command after receiving this
error message.

Sample communication:
The command “_dummy” is not supported by the peer (in this case the server).

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRCMD,,_dummy,Inline</td>
<td>$FRERR,NotSupported,_dummy not</td>
</tr>
<tr>
<td></td>
<td>supported*66</td>
</tr>
</tbody>
</table>

Invalid use of protocol

If the server thinks the client uses the protocol in an invalid way it returns FRERR with the code set to “Invalid”. The client must close the connection, and login again after this happens.

Sample communication:
If the client doesn't send FRVER before it starts to execute a command. In the case below the client has logged
in using FRLIN, but forgot to send FRVER. And then it tries to execute a command. This scenario is not a valid
v1.1 scenario, and the server responds with a FRERR Invalid.

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRCMD,,_getupdaterules,Inline</td>
<td>$FRERR,Invalid,FRVER must be sent to</td>
</tr>
<tr>
<td></td>
<td>server first*25</td>
</tr>
</tbody>
</table>

GpsGate Protocol over XML/HTTP

The HTTP/XML implementation is very similar to the TCP/IP protocol and follow this pattern

Client sends a HTTP POST on port 8008 path “/GpsGate/” to server with the following content

```
<cmd name="CommandName" al="arg" ...>
  <nmea><d>$FRPOS</d><d>...</d></nmea>
  <nmea><d>...</d></nmea>
  ...
</cmd>
```

The server response is

```
<ret name="CommandName"/>
```

Or for an error

```
<ret name="CommandName">
  <nmea><d>$FRERR</d><d>Code</d><d>Free text</d></nmea>
</ret>
```
A post can include any number of commands. Most commands requires you to login, therefor you should start with a _Login command.

```xml
<cmd name="_Login">
  <nmea><d>$FRVAL</d><d>Username</d><d>user1</d></nmea>
  <nmea><d>$FRVAL</d><d>PW</d><d>8IVHF</d></nmea>
</cmd>
```

Note that the password uses a simple "encryption" algorithm described in Appendix 2

Most commonly you then execute the _SendMessage command. Use a "GpsGate Generic Device" device mapper. Send status messages to the "GpsGateDevice" namespace. But you can execute any command supported by your GpsGate Server installation.

A sample dump (including HTTP header). From client to server. In this sample chunked data is used, fixed size is also ok. Note the path "/GpsGate/"

```
POST /GpsGate/ HTTP/1.1
Host: localhost:7500
Transfer-Encoding: chunked
Expect: 100-continue
Connection: Keep-Alive

196
<gpsgate><cmd
  name="_Login"<nmea><d>$FRVAL</d><d>Username</d><d>user1</d></nmea>
  <nmea><d>$FRVAL</d><d>PW</d><d>8IVHF</d></nmea></cmd><cmd
  name="_SendMessage" a
  0="0"
  a1="1"><nmea><d>$FRPOS</d><d>0200.00000</d><d>N</d><d>00100.00000</d><d>E<
  /d><d>0.0</d><d>5.832</d><d>4.0</d><d>121107</d><d>142600.000</d><d>

/nmea<nm ea><d>$FRVAL</d><d>Switch1</d><d>1</d>/</d><d>GpsGateDevice</d></nmea></cmd></gps
gate>
```

The response is

```xml
<ret name="_Login"/>
<ret name="_SendMessage"/>
```

### Incoming commands

A client or server supporting GpsGate Server Protocol v1.1 shall support the framework of sending commands using FRCMD + FRRET as described above. But it does not need to support any specific commands.

If a peer tries to execute a command that isn't supported FRERR with err_code “NotSupported” should be returned.

Below are some commands supported by GpsGate Server listed.

### _getupdaterules

_GpsGate Server v1.1 build 360 and later._

The command “_getupdaterules” is used by a client to ask server for recommended intervals to send position

Copyright Franson Technology AB, 2009
updates to the server.
The values typically include distance interval, time interval, speed and direction changes.
The rules should be OR:ed by the client. Rules not understood should simply be ignored.

**Sample communication:**

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRCMD,,_getupdaterules,Inline*1E</td>
<td>$FRRET,Johan,_getupdaterules,Nmea,4*43</td>
</tr>
<tr>
<td></td>
<td>$FRVAL,DistanceFilter,500.0*67</td>
</tr>
<tr>
<td></td>
<td>$FRVAL,TimeFilter,60.0*42</td>
</tr>
<tr>
<td></td>
<td>$FRVAL,DirectionFilter,40.0*30</td>
</tr>
<tr>
<td></td>
<td>$FRVAL,DirectionThreshold,10.0*42</td>
</tr>
</tbody>
</table>

**NOTE!**

1. The number of sentences following FRRET can be 0 to many.
2. The 4th field "4" in FRRET determines that there are 4 sentences following FRRET.
3. The answer may contain zero or many FRVAL sentences, and zero or many other sentences.

The client should simply ignore sentences it doesn't understand.

**Possible values returned by server**

<table>
<thead>
<tr>
<th>DistanceFilter</th>
<th>TimeFilter</th>
<th>SpeedFilter</th>
<th>DirectionFilter</th>
<th>DirectionThreshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distance in meters before a new position update should be sent to server.</td>
<td>Interval in seconds before a new position should be sent to server</td>
<td>Change in speed in meters per second, before a new position update should be sent to server by client.</td>
<td>Change of heading in degrees, before a new position update should be sent.</td>
<td>Distance in meters travelled before &quot;DirectionFilter&quot; should be considered.</td>
</tr>
</tbody>
</table>

**Notes:**
The rules should be "OR:ed".
Rules that are inactivated will not be sent back to the client.
Rules that are not understood by the client should simply be ignored.
The rules are recommendations from the server, so the server will also be able to handle position updates not following the rules.
More rules will be added in coming versions.

Example that demonstrates how a client logs into a server, asks for recommended update rules and then starts sending position updates to the server according to rules.

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRLIN,,user1,81VHF*7A</td>
<td></td>
</tr>
</tbody>
</table>

Copyright Franson Technology AB, 2009
_SendPosition

GpsGate Server 1.2 build 410 or later

The command “_SendPosition” is used to send a position update for the logged in user. You can control which track to save the position to, or if the position should not be saved to any track at all. The users current position will be updated, and the position information will be routed to other users that listens using FRRDT.

**Syntax:**

$FRCMD, username, _SendPosition, Nmea, 1, track_recorder_id*XX

$FRPOS...

<table>
<thead>
<tr>
<th>username</th>
<th>The logged in user. This field can be empty.</th>
</tr>
</thead>
<tbody>
<tr>
<td>_SendPosition</td>
<td>Name of command. Should be “_SendPosition”</td>
</tr>
<tr>
<td>Nmea</td>
<td>Indicates we have an NMEA sentence following the FRCMD sentence. Should be “Nmea”</td>
</tr>
<tr>
<td>1</td>
<td>One FRPOS sentence follows the FRCMD sentence. Should be “1”</td>
</tr>
<tr>
<td>track_recorder_id</td>
<td>Determines if and to which track the position should be saved. If left out or set to “0” the position is saved to the default “life track” If set to “-1” the position is only routed to listeners using FRRDT. Track data or current position is not saved. If set to “-2” the position is not saved to any track. The users current position is however updated. Or it can be set to a TrackRecorderID returned by the command “_CreateTrackRecorder”. The TrackRecorderID is an integer.</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA checksum</td>
</tr>
</tbody>
</table>

**Sample communication:**

In this sample the client has logged in as “User1”. The current position is updated for the user, and the default track – the “life track” - is updated.

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
</table>

Copyright Franson Technology AB, 2009
_CreateTrackRecorder

GpsGate Server 1.2 build 383 or later

The command "_CreateTrackRecorder" creates a track recorder on the server for the logged in user. A track recorder is necessary to record a track. Any number of track recorders can be created and used at the same time by one user. In this way parallel tracks can be recorded.

NOTE! You do not need to create a new track recorder each time the user logs in. Let the client remember the track recorder ID, and continue to use it. The server will determine when and how to create new tracks of the data, depending on the server side track recorder settings. Only create several track recorders if you want to record parallel tracks in time.

Syntax client command:

$FRCMD, username, _CreateTrackRecorder, Inline, track_name*XX

<table>
<thead>
<tr>
<th>username</th>
<th>The logged in user. This field can be empty.</th>
</tr>
</thead>
<tbody>
<tr>
<td>_CreateTrackRecorder</td>
<td>Name of command. Should be “_CreateTrackRecorder”</td>
</tr>
<tr>
<td>Inline</td>
<td>Should be “Inline”</td>
</tr>
<tr>
<td>track_name</td>
<td>Name of track recorder. Tracks created by this track recorder will get this name.</td>
</tr>
</tbody>
</table>

Syntax return value from server:

$FRRET, username, _CreateTrackRecorder, Inline, track_recorder_id*42

<table>
<thead>
<tr>
<th>username</th>
<th>The logged in user.</th>
</tr>
</thead>
<tbody>
<tr>
<td>_CreateTrackRecorder</td>
<td>Name of command. Always “_CreateTrackRecorder”</td>
</tr>
<tr>
<td>Inline</td>
<td>Should be “Inline”</td>
</tr>
<tr>
<td>track_recorder_id</td>
<td>ID of created track recorder. This is an unsigned 32-bit integer value.</td>
</tr>
</tbody>
</table>

Sample communication:

This sample creates a new track recorder named “TestTrack” for the logged in user. The server returns the track recorder id “2”.

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>$FRCMD, _CreateTrackRecorder, Inline, TestTrack*00</td>
<td>$FRRET, User1, _CreateTrackRecorder, Inline, 2*42</td>
</tr>
</tbody>
</table>
The command "_SaveTrackData" saves a range of positions to a track recorder created by "_CreateTrackRecorder". "_SaveTrackData" cannot be used to store data to the "life track".

Note that the server has track recorder settings that will limit the number of saved positions in the track depending on how the settings are made. See "_getupdaterules" for more information.

If the command fails no positions are stored into the track. A FRRET returned from the server indicates the positions has been successfully saved to the server track.

**Syntax:**

```
$FRCMD,username,_SaveTrackData,Nmea,position_count,track_recorder_id*XX
$FRPOS...
$FRPOS...
...
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>The logged in user. This field can be empty.</td>
</tr>
<tr>
<td>_SaveTrackData</td>
<td>Name of command. Should be &quot;_SaveTrackData&quot;</td>
</tr>
<tr>
<td>Nmea</td>
<td>Indicates we have an NMEA sentence following the FRCMD sentence. Should be &quot;Nmea&quot;</td>
</tr>
<tr>
<td>position_count</td>
<td>Number of FRPOS sentences following the FRCMD sentence. Each FRPOS sentence represents one position to be saved into the server track recorder. Do not send more than twenty (20) FRPOS sentences at a time. The server may or may not refuse larger transactions.</td>
</tr>
<tr>
<td>track_recorder_id</td>
<td>Determines if and to which track the position should be saved. Set to a track recorder returned by the command &quot;_CreateTrackRecorder&quot;. The track recorder is an integer. Value cannot be left out.</td>
</tr>
<tr>
<td>XX</td>
<td>NMEA checksum</td>
</tr>
</tbody>
</table>

**Sample communication:**

This sample saves two positions for the logged in user to a track recorder created by "_CreateTrackRecorder" (see above). The user name in FRPOS can be left out to save bandwidth.

```plaintext
Client                          Server
$FRCMD,,_SaveTrackData,Nmea,2,2*54
$FRPOS,0100.00000,N,00100.00000,E,0.0,1.944,0.0,011206,120000.000,*5C
$FRPOS,0200.00000,N,00200.00000,E,0.0,3.888,0.0,011206,120002.000,User1*5D
$FRRET,User1,_SaveTrackData,Inline*53
```

Copyright Franson Technology AB, 2009
_SendMessage

_GpsGate Server v2.0 and later._

The command "_SendMessage" is used by a client send geo coded messages to the server.

The values typically include status information from a vehicle, like pressure, temperature, engine on/off, an alarm signal etc.

**Sample communication to GpsGate Message Namespace:**

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$FRCMD,,_SendMessage,Nmea,3*62</code></td>
<td><code>$FRRET,User1,_SendMessage,Inline*7A</code></td>
</tr>
<tr>
<td><code>$FRPOS,1558.80000,N,04748.00000,E,34.0,19.438,89.0,140608,122341.562,*61</code></td>
<td></td>
</tr>
<tr>
<td><code>$FRVAL,Engine on,1,,*71</code></td>
<td></td>
</tr>
<tr>
<td><code>$FRVAL,Temperature,23.4,,*18</code></td>
<td></td>
</tr>
</tbody>
</table>

The number of FRVAL may be zero or as many is you like. The FRPOS is optional, if it is not included the messages will not be geo coded.

The message name (in the sample above “Temperature” and “Engine on”) must be registered on the server. See Appendix 3 for more information.

**Sample communication to GpsGateDevice Message Namespace:**

<table>
<thead>
<tr>
<th>Client</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$FRCMD,,_SendMessage,Nmea,3*62</code></td>
<td><code>$FRRET,User1,_SendMessage,Inline*7A</code></td>
</tr>
<tr>
<td><code>$FRPOS,1558.80000,N,04748.00000,E,34.0,19.438,89.0,140608,122341.562,*61</code></td>
<td></td>
</tr>
<tr>
<td><code>$FRVAL,Switch1,1,,GpsGateDevice*36</code></td>
<td></td>
</tr>
<tr>
<td><code>$FRVAL,Analog3,34.56,,GpsGateDevice*37</code></td>
<td></td>
</tr>
</tbody>
</table>

See Appendix 4 for complete overview of GpsGateDevice Message Namespace.

The GpsGateDevice Message values are mapped into GpsGate Message values using the Device Mapper. If you implement a tracker device or proxy using GpsGate Protocol, it is recommended that you use GpsGateDevice Message Namespace, and map the signals to more meaningful variables on the server using Device Mapper.

Either you must use IMEI number as login. Or if you use username+password as login for the device the device's name must be the same as the "name_and_version" filed in FRVER sent to the server.

Appendix 1 - NMEA checksum calculation

C++

```c
#define NIBBLE2HEX(c) ((c) > 9 ? (c) + 'A' - 10 : (c) + '0')

// buf is a char[] array which contains the NMEA sentence without trailing checksum.
// E.g. "$FRLIN,,user1,8IVHF" and "*7A" will be added

// buf_inx is an index to the last free position in the buffer

int checksum = 0;
int inx;
for(inx = 1; inx < buf_inx; inx++)
{
    checksum ^= buf[inx];
}
buf[buf_inx++] = '*';
buf[buf_inx++] = NIBBLE2HEX((checksum >> 4) & 0xf);
buf[buf_inx++] = NIBBLE2HEX(checksum & 0xf);
```

Appendix 2 - Password algorithm in C#

```csharp
private string m_InvertString(string strToInvert)
{
    StringBuilder builder = null;
    if (strToInvert != null)
    {
        builder = new StringBuilder();
        int iLength = strToInvert.Length;
        for (int iIndex = iLength - 1; iIndex >= 0; iIndex--)
        {
            char c = strToInvert[iIndex];
            if (c >= '0' && c <= '9')
            {
                builder.Append((char)(9 - (c - '0') + '0'));
            }
            else if (c >= 'a' && c <= 'z')
            {
                builder.Append((char)(('z' - 'a') - (c - 'a') + 'A'));
            }
            else if (c >= 'A' && c <= 'Z')
            {
                builder.Append((char)(('Z' - 'A') - (c - 'A') + 'a'));
            }
        }
        return builder != null ? builder.ToString() : null;
    }
}
