Suppose you create an uninitialized vector as follows:

```
vector<int> evec;
```

After adding the statment,

```
evec.push_back(21);
```

what will happen?

VuAnswers.com

Answer (Please select your correct option)

It will add an element to the start of evec and will initialize it with 21.

It will add an element to the center of evec and will reinitialize it with 21.

It will delete an element to the end (the back) of evec and will reinitialize it with 21.

It will add an element to the end (the back) of evec and initialize it with 21.

Made by: Waqar Siddhu

```
class DocElement
{
public:
    virtual void Print() { cout << "Generic element"; }
};
class Heading : public DocElement
```

VuAnswers.com

Answer (Please select your correct option)

Generic element

Heading element

Paragraph element

Nothing will be printed.

This specialization can be used as the common implementation for all Vectors of pointers.

This specialization can then be used as the implimentation for all types of classes.

This specialization can then be used for double type pointers.

This specialization should be used for Vectors of int types.
