Sanitation (see preceding pg)<ul style="list-style-type: none"><li>.. Single towel, hygiene workers &amp; machine</li><li>.. Teat dipping, postmilking</li><li>.. Machine function checked routinely</li></ul></li><li>. Segregate infec. from clean cows<ul style="list-style-type: none"><li>.. Cull infected cows, or</li><li>.. Separate pos. &amp; neg. groups<ul style="list-style-type: none"><li>... Milk pos. last, cull as value goes down</li></ul></li></ul></li><li>- Dry cow Tx, hi % of failures, still use bec. helps eliminate <i>Strep. agalactiae</i>; not <i>Staph. aureus</i></li></ul></li><li>• Individual cows<ul style="list-style-type: none"><li>- Lactating cow Tx limited (abscesses in gland hard for antibiotics to reach)</li><li>- Dry off when no longer profitable &amp; Cull</li></ul></li><li>• Blue bag: amputating affected teat facilitates drainage &amp; sloughing (weeks)</li><li>- Recovered cows often sold for slaughter</li></ul></li></ul>				
					#1 mastitis, subclinical, contagious, Exotoxin <ul style="list-style-type: none"><li>• CS: Chronic subclin., Toxemic; "Blue bag"</li><li>• Dx: Hx, CS, SCC, Culture</li><li>• Tx: Herd (hygiene, dip &amp; isolate), Cull</li></ul>	PH Public Health <ul style="list-style-type: none"><li>• Some Staph. produce enterotoxins in stored milk products which can multiply<ul style="list-style-type: none"><li>- Food poisoning</li></ul></li></ul>		

## • Strep. mastitis

Mk 687; C3T 763; IM 1188; VC/M 491, 496, 503; BR-hb 251; BR 563; Br 296, 345; DC 279

\*\*\*

## • *S. agalactiae*

### - Highly contagious

• **Obligate** inhabitant of mammary gland, **thus it can be eliminated from herd**

• Cow to cow transmission

- Doesn't invade mammary tissue, damages epithelium, causing PMN outpouring, blockage, fibrosis & decr. secretion

## • Environmental Strep. (*S. dysgalactiae* & *S. uberis*)

- Lower infec. rate bec. not contagious

- Can't be eliminated from herd (environment)

## • *Strep. agalactiae*

- Usually subclinical

- Occasional flare-ups

- Similar signs to Staph.

## • History, CS

• SCC (somatic cell count)

• Culture

## • *Strep. agalactiae*

- Elimination possible 1-2 years

• Milk hygiene, 1 towel, gloves

• Teat dipping

• Dry or lactating cow AB therapy

- Intramammary penicillin G, highly effective (withholding times)

## • Environmental Strep. spp. (*S. uberis*)

- Can't be eliminated bec. environmental

- M/ be more resistant to penicillin, other choices: chlortetracycline, oxytetracycline, cephalosporin, Na cloxacillin

- Routine dry cow therapy

- Sanitation of environment

- Sand bedding

## #1 *Strep. agalactiae* (Contagious; m/b eliminated)

CS: Subclinical w/ flare ups

Dx: Hx, CS, SCC, Culture

Tx: Sanitation, Teat dip, Dry/Lactating - Pen G

## Control

Elimination of *S. agalactiae* possible:

• Susceptible to antibiotics

- Obligate inhabitant of mammary gland, not environment

- Doesn't invade tissue, susceptible to ABs

## • Coliform mastitis; Gram-neg.

Mk 688; C3T763; IM 1189; VC/M 510, 490, 496, 503; BR-hb 251; BR 563; Br 297, 339; DC 286

\*\*\*

## • Environmental mastitis

- *E. coli*, *Enterobacter aerogenes*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Pasteurella multocida*, *Setaria* spp.

• Acute clin. mastitis in early lactation

• Transmission:

- **From environment** (not like *Staph. aureus*, *Strep. agalactiae*)

- Milking wet udders incr. incidence

- Low cell counts (SCC) in udder, predispose

- Single quarter usually

- Inflammation destroys coliforms & releases endotoxins

## • Acute clinical mastitis

- Uniform swelling of affected quarter

- Watery milk

• Subclinical infection uncommon

• **Toxic shock:**

- Acute, m/b peracute - death

- High fever, anorexia, depression, milk ceases, rapid weight loss

- Recumbency

- Pulmonary hypertension

- Abortion

- Diarrhea

- Death (5%)

## • History, CS

• Little fibrosis or induration

• SCC

• Culture

Unique - upon recovery, gland returns to capacity

## • Sanitize envir. over indiv. cow Tx

- Milking hygiene, individual paper towels, premilking teat dip? Postmilking dip does not prevent infec.

- Sanitize environment

• Bedding: sand better than shavings or sawdust

- Feed right after milking to keep cow standing while teat canals close

## • Individual cow mastitis

- **Spontaneous recovery** (most cases)

• Intramammary infusion

- **Severe: Endotoxin/mediator shock**

- Milk out every 2 hrs or allow calf to suckle (decr. endotoxins & inflam. mediators & bacteremia)

- IV ABs, sulfamethazine or oxytetracycline

- Intramammary ABs, following complete milking (cephalosporin, ampicillin, aminoglyc., polymyxin B)

- IV fluids (initially 5-10 L/hr 2 hrs; then 5 L/hr)

- Aspirin or Banamine® (cause abomasal ulcers)

## Acute clinical mastitis in early lactation, Envir.

CS: Acute mastitis, Toxic shock

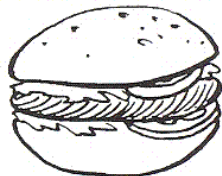

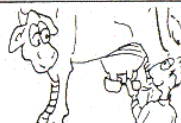

Dx: Hx, CS, SCC, Culture

Tx: Envir. sanitization, Feed after milking, Tx shock

## Mastitis

## SKIN - EYE - MAMMARY

Condition	Facts/Cause	Presentation/CS	Diagnosis	Treatment
<b>Mycoplasma mastitis</b> Mk 689; C3T 763; IM 1190; VC/M 475; BR-hb 251; BR 563; Br 298, 342; DC 283 *** 	<ul style="list-style-type: none"> <li>• <i>Mycoplasma bovis</i>, <i>M. californicum</i>, <i>M. canadensis</i>, <i>M. bovigenitalium</i>, <i>M. alkalescens</i></li> <li>• Probable systemic phase (rapid spread to other quarters &amp; to joints)</li> <li>• Extremely contagious</li> <li>• Chronic carriers</li> </ul>	<ul style="list-style-type: none"> <li>• Possibility of explosive outbreaks</li> <li>• Usually severe mastitis</li> <li>• Secretions watery to purulent</li> <li>• Spreads from quarter to other quarters</li> <li>• Tannish-brown milk, sandy flakes that float</li> <li>• Milk secretions m/ cease until next lactation</li> <li>• Not systemically ill, eats</li> <li>• Mild forms - indistinguishable from Staph., Strep. or coliform mastitis</li> <li>• Sequelae</li> <li>- Arthritis &amp; lameness</li> </ul>	<ul style="list-style-type: none"> <li>• History, CS </li> <li>• Nonresponsive mastitis</li> <li>• Neg. milk cultures using standard microbial methods</li> <li>• Fibrosis &amp; alveolar cell atrophy</li> <li>• Routinely culture bulk tank, fresh &amp; new cows</li> <li>- Specific microbiological &amp; serological tests</li> </ul>	<ul style="list-style-type: none"> <li>• Eradication program</li> <li>- Serial herd cultures</li> <li>- Slaughter or segregate for life</li> <li>• No Tx</li> <li>- Do not respond to therapeutic Tx</li> </ul> 
<b>Salmonella mastitis</b> C3T 764; IM 1191 **	<ul style="list-style-type: none"> <li>• Rare; <i>Salmonella dublin</i>, Public health problem, Neonatal health</li> <li>• Chronic, acute, or subclinical, Occasional flare-ups similar to chronic coliform mastitis</li> <li>• Dx: ELISA assay for <i>S. dublin</i> antibody levels</li> <li>• Tx: Cull carrier cows (public health &amp; neonates)</li> </ul>	PH 	<ul style="list-style-type: none"> <li>• History of nonresponsive mastitis</li> <li>• Negative milk cultures</li> </ul>	
<b>Corynebacterium bovis mastitis</b> Mk 689; C3T 764; IM 1191; Br 297 **	<ul style="list-style-type: none"> <li>• Rare; Colonize teat canal, but cause little pathology; Consistent culturing indicates ineffective teat dipping, Questionable if protective to other infec. by raising SCC</li> <li>• CS: Asymptomatic, mild inflammation</li> <li>• Dx: Mild elev. SCC, Culture</li> <li>• Tx: Routine teat dipping prevents infection</li> </ul> 			
<b>Leptospira mastitis, "Flabby bag"</b> C3T 764; Br 298, 569 *	<ul style="list-style-type: none"> <li>• Rare; Hematogenous dissemination; Causes vasculitis</li> <li>• CS: "Milk drop syndrome": abrupt termination of milk secretion, leakage of blood in milk (brownish orange), Flaccid udder ("Flabby bag")</li> </ul>			
<b>"Summer mastitis", "August bag"</b> C3T 764; Br 301, 343; VC/M 512 *	<ul style="list-style-type: none"> <li>• Rare; Common in N. Europe, reported in Florida; Dry cow &amp; parturient heifers; mixed infec. (<i>Actinomyces pyogenes</i> + anaerobic bact. [<i>Peptococcus indolicus</i>]). Transmission: teat canal or biting flies (horn fly)</li> <li>• CS: Distended, swollen teat, hard gland, foul, thick yllw secretion, fever; Acute: toxemia - shock, DIC (disseminated intravascular coagulation), abortion &amp; death</li> <li>• Dx: Hx, CS, Destroyed udder, Extensive necrosis of mammary tissue, abscesses &amp; fistulous tracts; Abortions</li> <li>• Tx: Salvage; Prevention: Fly control, prophylactic dry-cow therapy</li> </ul>		  	
<b>Other mastitic agents</b> IM 1191; VC/M 571, 572; Br 763, DC 292 *	<ul style="list-style-type: none"> <li>• Considered atypical, rarely problems (<i>Cryptococcus neoformans</i>, <i>Bacillus cereus</i>, <i>Nocardia</i> spp, <i>Mycobacterium</i>, <i>Clostridium</i> spp, <i>Candida</i> spp, <i>Pseudomonas</i>, <i>Setaria</i> (check hot water supply)</li> <li>• Zoonotic implications: <i>C. neoformans</i>, <i>Leptospira</i> spp. &amp; <i>Nocardia</i> spp., so handle infected samples w/ care</li> </ul>			

## Milk collection technique

- Sterile tubes, 15 ml, tight fitting seal
- Foremilk collection samples (better than during milking because more organisms)
- Wash udder & teat, let drain, dry w/ single use paper towel
- Strip each teat 2 or 3 times (initiates milk let down & removes some streak canal contaminants)
- Individual quarter samples (identify infected quarters, 1 or all 4)
- Quarter samples together - identify infected animals
  - Scrub teat end & orifice until clean w/ 70% alcohol (ethyl or isopropyl), using separate cotton ball or gauze for each
  - Clean 2 quarters furthestmost away, then closest
  - Collect teats closest, then farthestmost away
  - Fill horizontally-held tube 1/2 full & seal (do not touch teat to tube)
  - Clean & thoroughly dry hands between cows (germicidal sol.) or use disposable gloves

## Transport collected milk

- Process ideally in 15 to 30 min. (sure!)
- Cool to 39.2-41° F (4-5° C) if > 30 min. to processing
- Freezing reduces no. of bacteria
  - Can't determine SCCs (somatic cell counts), but ok for cultural assays
  - CMT, WMT & Gelatin-based assay can be performed on frozen samples
  - Avoid repeated freezing & thawing
  - Staph. recovery m/b enhanced by single freeze, thaw
- Storage at 39.2° F (4° C) for 1 wk or frozen will not affect isolation of most common mastitis pathogens

**Routine milk culture:** determines cause of clinical mastitis in a herd

- Culture all infected quarters
- Freeze or refrigerate before culture
- Culture before therapy
- Antibody susceptibility testing for future Tx
- Do routinely or at least whenever unusual mastitis
- 25-30% will be negative
  - Coliform mastitis: short duration, cow's defense controls
  - Coliform mastitis: most common cause of mastitis even in herd w/ chronic Staph. or Strep. infection
- Culture m/ reveal presence of *S. agalactiae*, *S. aureus* or *Mycoplasma*

## Herd cultures:

- Culture all cows in herd
- Done when contagious bact. suspected (*Strep. agalactiae*, *S. aureus*, *Mycoplasma bovis*)
- ID infected cow for isolation &/or Tx (*S. agalactiae*)
- Composite samples (all 4 quarters)

## Selective survey cultures:

- Testing on basis of elev. SCCs
- Incr. chance of finding infected animal w/ less testing, but misses some positive animals

## Bulk-tank milk cultures

- Monthly cultures of bulk-tank to monitor herd
- Inexpensive monthly monitor of herd mastitis status
- Negative test indicates no or low presence of pathogens
- Swab samples over entire blood agar plate

## Plating milk samples

- Mix milk sample (gently inverting or shaken)
  - Do not vortex samples for SCCs (m/ rupture cells)
- Sterile swab swirled at bottom of tube (if contacts anything else, hand or counter top, throw away. Calibrated loop for estimating # of bacteria)

## Streaking samples: a number of techniques

- 4 quadrants - BBA plate (5% bovine blood agar):
  - Divide bottom of plate into 4 & mark them A, rt. cran.; B, rt. caud.; C, lt. cran.; D, lt. caud.)
  - Open lid, streak a milk line from appropriate qtr. in center of quadrant, then streak side to side across quadrant, repeat for other quarters.
  - cAMP test for *S. agalactiae*: m/b done at same time
    - Sterile *S. aureus* hemolysis streaked across quadrants of blood agar plate
    - Streak milk as in 4 quadrant tech.
    - *S. agalactiae* causes synergistic β hemolysis
- Half plates - for composite samples
- Entire plates - for bulk-tank samples

## Interpreting test results

- **Single colony of *S. agalactiae*, *S. aureus*, or *Mycoplasma* spp. diagnostic for intramammary infection** (all assoc. w/ gland, not environ., highly contagious)
- Other isolates m/ be contamination from environment, confirm cause by:
  - Conc. of bacteria in sample
  - Purity of culture
  - Intramammary inflammation (elev. CMT)
  - Organism on repeat sampling

**80% of cows w/ SCC > 200,000 are infected**

Checking for mastitis - strip cup or strip plate - first milk used, so clean udder. Should see coagulation.
