# 1. Without structure there is no architecture

A tent somewhere in the icy mountains

## 2. Structures without architecture are just structures

Eladio Dieste: Atlantida Church, 1960

**3. What is the purpose of the structure?  
What is the meaning of the structure?**

Collapse of a building due to earthquake

Daniel Libeskind: Royal Ontario Museum, Toronto, 2007.

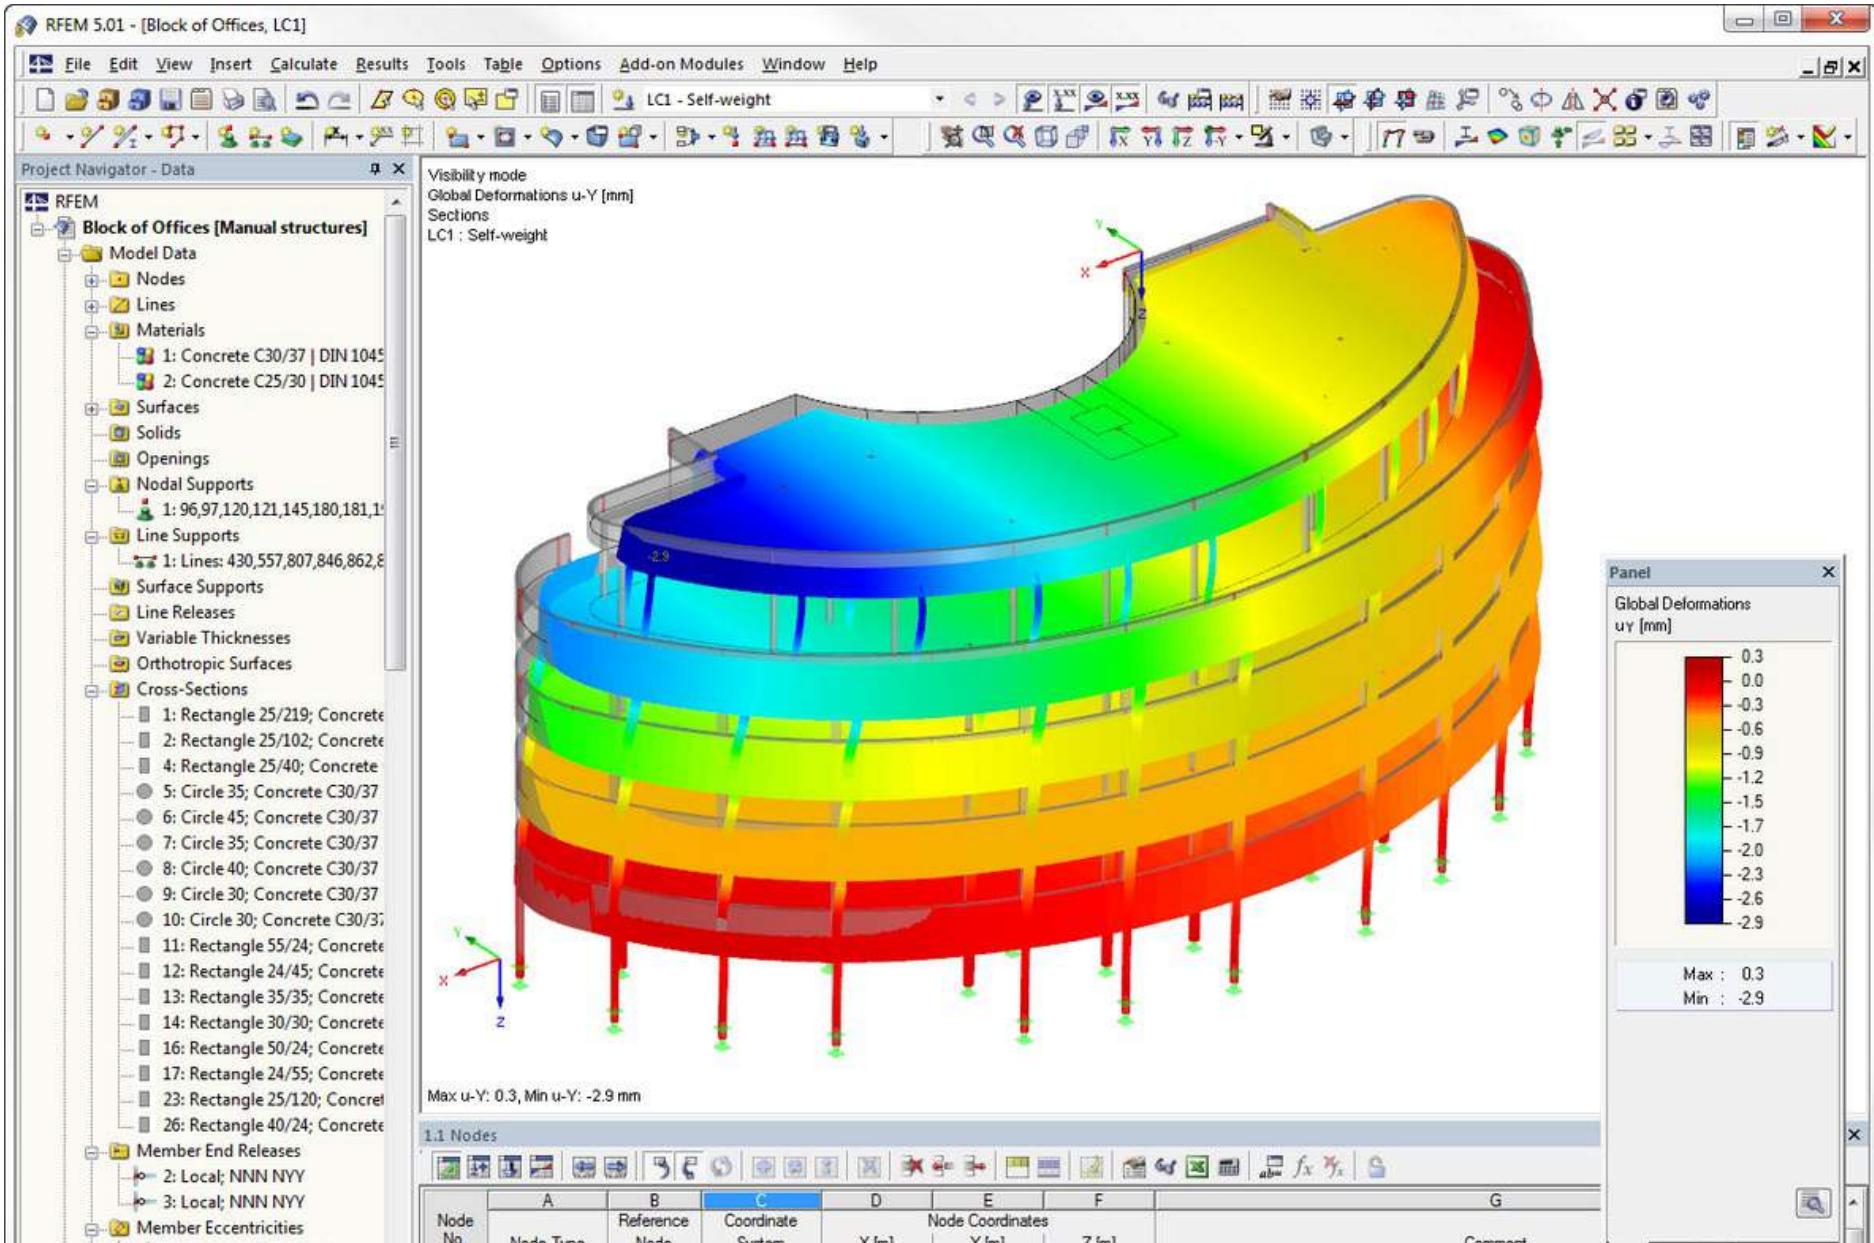

## 4. Structural Design is not about doing mathematical calculations

*«Structural design is concerned with much more than science and techniques: it is also very much concerned with art, common sense, sentiment, aptitud, and enjoyment of the task of creating oportune outlines to which scientific calculations will add finishing touches, substantiating that the structure is sound and strong in accordance with the requirements.*

*Mathematics is merely a convenient tool by which the designer determines the physical proportions and details of a planned structure in order to transform his ideas from the lines of a blueprint to the actuality of a finished structure»*

Eduardo Torroja

FEM structural analysis of a building.

## 5. Form matters

*„The resistant virtues of the structures that we make depend on their form. It is through their form that they are stable and not because of an awkward accumulation of materials. There is nothing more noble and elegant from an intellectual point of view than this, resistance through form“.*

Eladio Dieste

Model of Heinz Isler showing the structural resistance of doubly-curved surfaces

Heinz Isler: Sici Company Building, Geneva, 1970

## 6. Nature knows something...but don't directly imitate nature

Spiderweb

*„It's not very scientific to take nature as a model; nature can't be imitated because it's very complex. In principle it seems very simple but it is actually very complicated and should not be interpreted mistakenly. People say that I focus on biology only to create new structure, but that's not true. I am just very curious to know what nature is“.*

Frei Otto

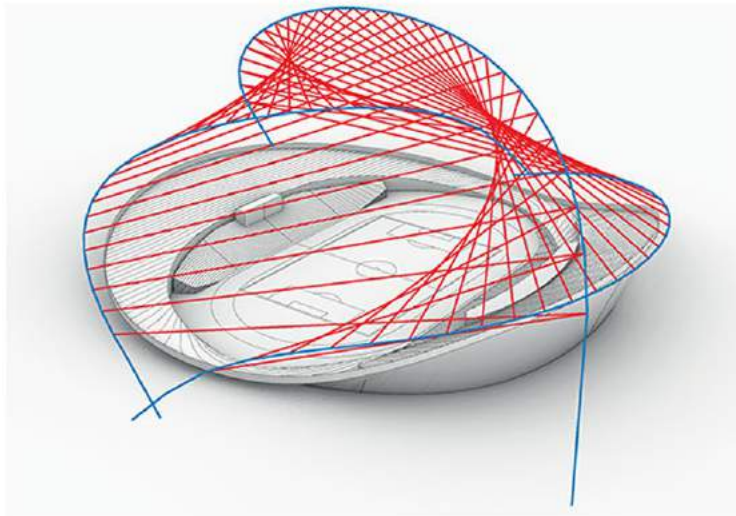

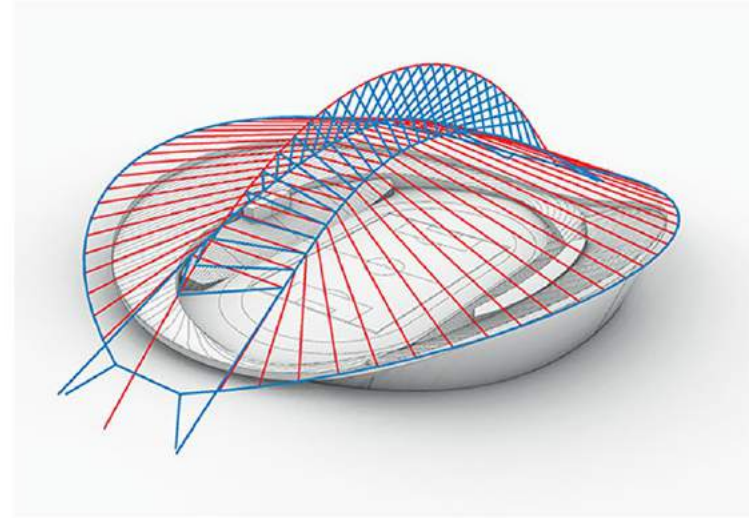

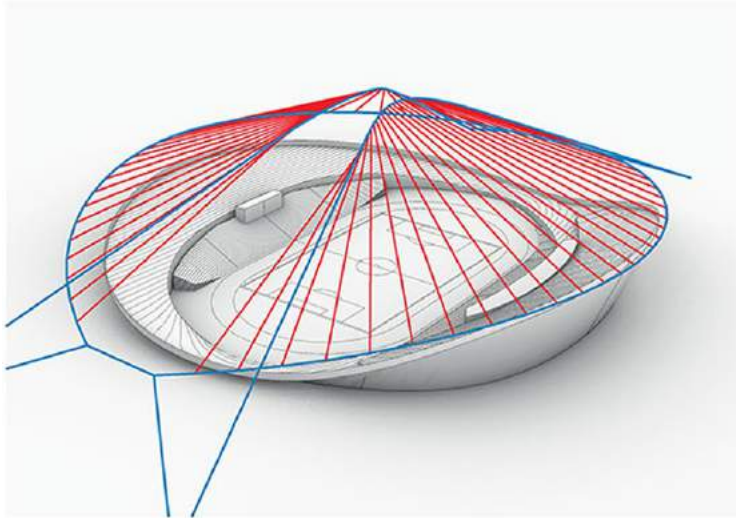

Frei Otto: Montreal Pavilion, Montreal, 1967.

## 7. Creativity is essential

*„During the conceptual phase in particular, it is imperative for the engineer to pay special attention to the internal forces, to make the load-bearing form congruent with these forces and, most importantly, to exhaust the possibilities offered by three-dimensional structural analysis“.*

Joseph Schwartz

Patrick Ole Ohlbrock and Pierluigi D'Acunto: Combinatorial Equilibrium Modelling

## 8. Each material likes a certain form

*«To express is to drive.  
And when you want to give something  
presence,  
you have to consult nature.  
And there is where design comes in.*

*And if you think of brick, for instance,  
and you say to brick:  
'What do you want, brick?'  
And brick says to you:  
'I like an arch.'  
And if you say to brick:  
'Look, I want one, too, but arches are  
expensive and I can use a concrete lintel.'  
And then you say:  
'What do you think of that, brick?'  
Brick says:  
'... I like an Arch' »*

Louis I. Kahn

Louis Kahn: Fort Wayne Performing Arts Theater, Indiana, 1958-73.

## 9. The term efficiency can be very confusing

Introduction

1. Cables and Arches

2. Arch-cables and Trusses

3. Beams and Frames

4. Plates and Bracing

5. Materials

6. Structural Design

Exercise 1:  
Cables  
and Arches

Exercise 2:  
Arch-cable  
and Trusses

Exercise 3:  
Beams  
and Frames

Exercise 4:  
Plates  
and Bracing

Exercise 5:  
Materials

Exercise 6:  
Structural Design

At the conclusion of this course, students will be able to:

1. Visualize the internal forces within two-dimensional structural elements.
2. Understand the relationship between the form of a structure and the internal forces within it.
3. Identify the most important structural typologies.
4. Use graphic statics for the form-finding and analysis of structures.
5. Carry out basic dimensioning of structural elements.
6. Conduct basic assessment of the structural behaviour of a building.
7. Understand the structural and architectural possibilities of the most important building materials.

# Schedule

| Week | Date       | Type       | Title                   |
|------|------------|------------|-------------------------|
| 1    | 17.09.2020 | Lecture 0  | Introduction            |
| 2    | 24.09.2020 | Lecture 1  | Cables and Arches       |
| 3    | 01.10.2020 | Exercise 1 | Cables and Arches       |
| 4    | 08.10.2020 | Lecture 2  | Arch-cables and Trusses |
| 5    | 15.10.2020 | Exercise 2 | Arch-cables and Trusses |
| -    | 22.10.2020 | -          | Seminar Week            |
| 7    | 29.10.2020 | Lecture 3  | Beams and Frames        |
| 8    | 05.11.2020 | Exercise 3 | Beams and Frames        |
| 9    | 12.11.2020 | Lecture 4  | Plates and Bracing      |
| 10   | 19.11.2020 | Exercise 4 | Plates and Bracing      |
| 11   | 26.11.2020 | Lecture 5  | Materials               |
| 12   | 03.12.2020 | Exercise 5 | Materials               |

The Cremona diagrams allows to understand the disposition, strength and paths of forces inside the structure in a simple and graphical way.

Its reading has to be done in the elevation illustration and most of the time vectors need to be reinterpreted with the plan. By combining the two readings and understandings from these, we can find the real forces in the structure.

Valentin Locher, Julien Tacca, Böwing Nick and Vetterli Noemie
