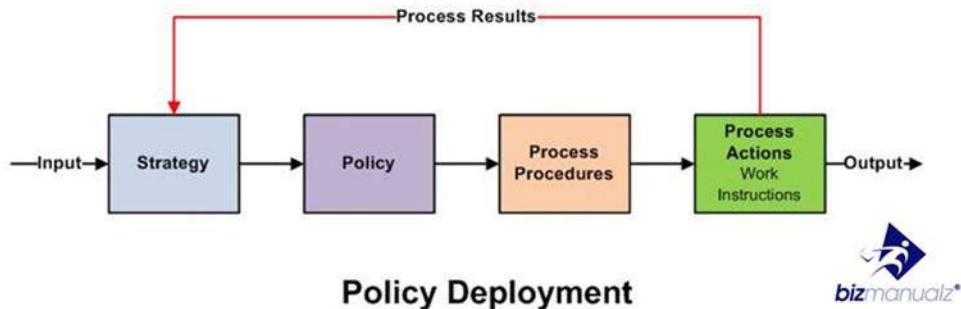

Figure 1 Policy Deployment Process

What is a procedure?

A “procedure” is a term used in a variety of industries to define a series of steps, taken together, to achieve a desired result.

Figure 1 shows where procedures fit in the deployment of a company’s strategy. Procedures explain how to accomplish a task, realize a policy, and help the company achieve its strategy. A procedure is sometimes called a work instruction. If you are preparing an ISO 9001 quality management system, then the term procedure is used to describe a process, whereas a work instruction is used to describe something more basic like a specific step in a process. For example, how to fill out a form. Procedures are known in other ways too.

Procedure Definition

A procedure is a series of steps, taken together, to achieve a desired result. It is a particular way of accomplishing something as in a repetitive approach, process or cycle to accomplish an end result. To make an effective process procedure we need to ensure that each repetition of the process has the ability to achieve the desired or planned results.

You may hear people ask about the SOP for purchasing new equipment. In this context an SOP is a Standard Operating Procedure (SOP). In other words, what are the steps for purchasing new equipment? These steps could be a checklist or ordered list, which we may also call a Work Instruction. These steps may include effectiveness criteria or controls to ensure the process is effective.

Can you purchase anything you want or are there controls like a budget, quality standards, approved vendors, or engineering specifications? Customers of the Purchasing Procedure are entitled to consistent service delivery based on established and accepted procedures—not on any one worker's personal values, and not varying from one geographic area to another.

Compliance Procedures

Procedures are required by compliance standards such as ISO in quality, Sarbanes-Oxley for public company accounting, or the Joint Commission in healthcare. We also use procedures to train new employees on a process in order to obtain more consistent results. Procedures are used to document company knowledge to ensure important information is retained. We also use procedures in process improvement to document the future state of a process after we improve it so that we may communicate the new steps to others.

Over time, procedures improve and evolve into "best practices". Sometimes these are called Good Manufacturing Practices or GMP for short. A GMP is an SOP that has evolved into a best practice. The medical device and pharmaceutical manufacturing industry refers to a procedure as a GMP in their quality system.

Policies and Procedures

Procedures are often associated with or supported by other documents like policies. What's the difference between a policy and a procedure? The policy is the goal statement and the procedure is the description of how to achieve the goal. So basically, every procedure should be associated with a policy.

Other procedure supporting documents may include:

- Process Maps
- Business Manuals
- Job Descriptions
- Reports, Forms, and Checklists
- Business Objectives
- FMEA, Control Plans, Quality Plans

Employee Policy Manual

If you are writing a company manual or employee handbook, you will define policies necessary to comply with various laws and regulations as well as your own company standards. These employee manuals include policies and sometimes also include procedures too.

As you grow you will require more than an Employee Handbook. Your Employee Manual will grow into a full business manual. Keep growing and each individual department will write their own policies and procedures manual. Larger company's write online policies and procedures because it is easier to communicate them to all employees at once.

Bizmanualz produces a full range of easily editable Microsoft Word templates covering your most important business departments:

- Accounting Policies for controlling assets
- Financial Procedures for managing cash
- Computer & IT Procedures for maintaining networks
- Sales & Marketing Plans for growing revenues
- Human Resources Policies to minimize employee liabilities
- Security Planning and Disaster Recovery to prepare for emergencies
- ISO 9001 Quality Manuals for customer satisfaction
- Policies and Procedures Supplements for industries

So What Is a Procedure?

By now, I hope we have answered “what is procedure.” A procedure is a way that you achieve consistent results. Procedures can be called a Standard Operating Procedure, SOP, GMP, work instruction or a best practice. Procedures are often required for compliance.

Your-Workers will have greater confidence that their actions are supported by management, underlying statutes and regulations by following established procedures.

Your customers are entitled to consistent service delivery based on established and accepted procedures—not on any one worker’s personal values and not varying from one geographic area to another.

Your stakeholders pay for the mistakes, errors, or failures that result from inconsistent performance to established procedures.

Procedures are helpful for training and procedures help to retain important information. If your company desires greater consistency, improved customer satisfaction, or better compliance then you will want to put policies and procedures in place.

Scope of this Book

The rest of this book will explain how to put procedures in place. We will follow the process procedures journey (figure 2). First, we will look where procedures fit in within the context of the whole management system. Next, we will look at the building blocks of your procedures, your processes and how to map them out.

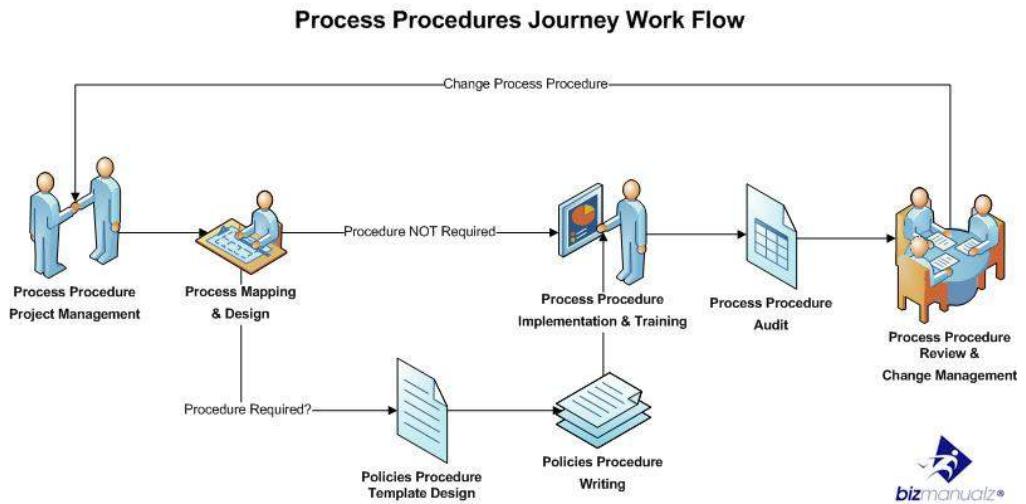

Figure 2 Process Procedures Journey Workflow

This is followed by how to turn your processes into procedures with tips on how to make your procedures more useful. Lastly, we will end with putting procedures together in a manual or online. We will cover the entire process procedures workflow.
