

# Synopsis: A Journey to the Core of the Sun

Oliver K. Manuel

(Dates are underlined in this historical documentation of 1945-2013 events.)

In 1960 Professor Paul Kazuo Kuroda, the first scientist from the Imperial University of Tokyo to investigate the ruins of Hiroshima in August 1945, persuaded me to undertake research on the "*Origin of the Solar System and Its Elements*."

Kuroda knew the horrors of war, the hopes for the future in forming the United Nations on 24 October 1945, and the inherent Orwellian danger of hiding information from the public to avoid possible nuclear annihilation. Kuroda probably also knew his assignment would reveal forbidden information: Nuclear blackmail at 24 October 1945 negotiations?

The source of energy in the cores of uranium atoms that destroyed Hiroshima on 6 August 1945 is the source of **energy in the core of the Sun** that created our chemical elements, birthed the solar system five billion years (5 Ga) ago, and then sustained the origin and evolution of life over the past three and a half billion years (~3.5 Ga).

FEAR of death from nuclear annihilation separated humans from a new reality that might have replaced historical superstitions with knowledge of mankind's connection with the Sun's pulsar core via powerful, invisible force fields that emanate from it.

Official responses to 17 November 2009 Climategate emails showed the supernova birth of the Solar System, the Sun's iron-rich interior, and neutron repulsion as the source of energy in cores of atoms, planets, stars and galaxies were discoveries frightened world leaders and guilt-ridden scientists had purposefully hidden from the public after 1945.

On 4 July 2013 - the 237th birthday celebration of this nation - the *Space Science and Technology Committee*, US House of Representatives was informed of misinformation they had received for the past sixty-eight years about energy (***E***) stored as mass (***m***) in cores of atoms, planets, stars and galaxies. Sixteen pages of documentation were sent to the *Committee* on 17 July 2013, another on 18 July 2013, and three concluding pages were sent on 8 August 2013. They are attached as the last twenty pages of this synopsis.

The next page is a photograph of a great humanitarian and genius, the late Professor Paul Kazuo Kuroda of The Imperial University of Tokyo and the University of Arkansas, who started me on this journey in 1960. His photograph (next page) and autobiography [1] of 13 April 1936 - 8 December 1983 events are a good place to start learning the real history of post-WWII science that culminated in the current global climate scandal:

1. Paul Kazuo Kuroda, *My Early Days at the Imperial University of Tokyo* (1992) 69 pp.
